PRepare 3 or 4 Pound of Oil of Sulphur *per* Campane, which rectifie, that it may become very fiery: Then provide a large Trough like a Cheſt or Box, which you may cover with linnen Cloath ſo, as through it no Duſt, but the Air onely may penetrate. In this Cheſt ſet your rectified Oil of Sulphur, poured into divers ſmall Pans or Diſhes ſo as they be not above half full. Leave theſe there three or four Days, or ſo long Day and Night expoſe them to the Air, as until the Oil of Sulphur hath drawn to it ſelf ſo much VVater as it ſelf was, and filled the Diſhes. This being done, empty out all the Diſhes into one Glaſs Body, and in *Balneo* with gentle heat abſtract thence all the humidity. The Oil remaining in the Bottome again expoſe to the Air in thoſe Diſhes, as before, ſo long as until they be filled. That water again abſtract thence, and proceed in extracting ſo long, as until you have got water enough. This water paſſeth through all Tinctures; but I have not as yet compleated this VVork.

Note: All the beſt of that, which this Magnet draws from the Air, remains with the Magnet it ſelf or Oil of Sulphur, as its true *Matrix*, in which it is nouriſhed and ripened; as the moſt Ancient *Hermes*, or the Father of all Philoſophers, in his Smaragdine Table, hath deſcribed in theſe words. Here the Soul of the VVorld ſpeaks. My Father is *Sol*; my Mother is *Luna*; the VVind or Air ſecretly bears me in its Belly: the Earth conceived and brought me forth, and is my Nurſe, *&c.* The Spirit of the VVorld can bring forth no Fruits, unleſs it be firſt ſeminated in a fit *Matrix*; becauſe nothing in the VVorld can be progenited without a VVomb. This our Magnet is of all Magnets moſt gratefull to the Soul of the VVorld, and a moſt natural Friend to the Spirit of the VVorld.

Much might be ſpoken touching this, but it is not neceſſary to thruſt pulſe ready chewed into a ſluggiſh Crows mouth, let him fly out and ſeek for himſelf. Here, in this Work are verified thoſe ſayings of Philoſophers: Nature rejoyceth in Nature, Nature overcomes Nature, Nature retains Nature. Here it is proper alſo to obſerve, what *Hermes*, at the end of his Table ſaith; *viz.* My power is not intire, or perfect, before I am turned into Earth. But how this is to be done, I leave to the conſideration of every Man. For the unworthineſs of the preſent wicked World forbids me to diſcourſe more amply thereof. To all men, whom GOD ſhall favour, theſe will be clear enough. Yet elſewhere touching this matter (if GOD will) ere long ſhall be taught.

CHAP. XVII.

How from Gold its Tincture may be extracted by help of a Magnet.

R *Ecipe* of moſt pure Gold an ounce and a half, and of the *Stellate Regulus* of Antimony made with Steel, one ounce, both which melt together in a covered Crucible; and whilſt in flux caſt at times a little Salt-peter, until the Niter ſhall have extracted all the *Regulus* of Antimony from the Gold, and turned it into *Scoria's*. Permit the whole to flow well for ſome time, that the Gold may well ſettle to the bottom from the *Scoria*, which will flow like water. Then pour all out into a Cone, where the Gold becomes a *Regulus*, which muſt be ſeparated from the *Scorias*. This *Regulus* of *Sol* comes forth much paler than it was before. If this pallid *Sol* be again melted with the aforeſaid Martial *Regulus*, and the *Regulus* thence abſtracted by the help of ſalt Niter, the Gold will come forth a little paler than it did the firſt time. If you repeat this Operation 8, 10, or 12 times, you will find your Gold at length almoſt totally white, and that its Tincture is extracted from it by the help of that *Regulus*. The Tincture of *Sol* is abſconded in the *Scorias*; this, by the benefit of a certain Antipathetick Salt, will be precipitated from the Fæces liquified, like a *Regulus* highly tinged.

Note: Yet in theſe Caſes, the Precipitation muſt be warily handled, leſt you alſo precipitate the *Regulus* [of Antimony] together with it, and ſo vitiate the Tincture. For this Extraction no vulgar *Regulus* is conducent, but ſuch onely, as is made of good Steel, and hath ſuch a property, as when a Flint is ſtrook upon it, it yields fiery Sparks, no otherwiſe, than as from hardned Steel. VVhich vertue, if it hath not, it cannot rightly draw to it ſelf the Tincture of Gold, but all endeavour will be in vain. This Extraction, *Coſmopolita*, in his new Chymical Light, hath very well deſcribed and diſcovered in theſe words. Such *Chalibs* muſt be taken, as is endewed with power of extracting that from the Rays of the Sun, which many have ſought, but few found. But further he ſaith: There is found yet another *Chalibs*, which from Gold extracts its Seed (if it be united or copulate with it 12 times) and thence is impregnated; but the Gold is infirmed even to death. But the *Chalybs* or Magnet brings forth a Son, which will be more excellent than his Father, *viz.* Gold, whence he proceeded, whoſoever knows this Magnet (of which *Coſmopolita* makes mention, and an hint of the preparation whereof I have here ſhewed) and underſtands how to uſe the ſame, in two or three Days he will behold and find ſo great things, as with the joy thereof his heart will be ſatisfied. For, if any one hath Philoſophick Eyes, he will ſee what is moſt pleaſing, if not, he will be no more delighted than a Swine, who among the Sweepings of Vineyards hath ſwallowed an ineſtmable Pearl or Jewel, but knows not the difference between a Pearl and that Dung.

CHAP. XVIII.

How from Gold its Tincture may be extracted by another Method, or by the benefit of a certain other Chalybs.

FIrſt, prepare the Green Lyon of Ancient Philoſophers (by help of my mineral Salt) of ſulphureous Subjects. To this Green Lyon caſt *Sol*, that is, pure Gold; which he, through his greedy deſire of devouring always, will ſwallow, and thereby acquire to himſelf notable Strength, Power and Beauty. For his whole Body will be thence renewed. His head, with the fore part of his Body will ſhine with a Graviſh Hair, very like a Crows Head; but his Tail with the hinder part of his Body will acquire many various and beautifull Colours, reſembling the genuine form

of the Rain-Bow, or the Tail of a Peacock. And as ſoon as the Green Lion hath ſufficiently concocted and digeſted the yellow Lion or *Sol* in his Stomach, he by Seidge expells the Reſidue, which will be void of Colour or Bloud. Then the Lion, proud and adorned with various and beautifull Colours, walks to the Waters, in which he immergeth himſelf, and waſheth away all his Colours, and becomes totally white like a Swan, which white Swan the Cook roaſteth at the Fire: where that white Swan firſt waxeth yellow, then more and more Red, untill he is able at length to bear the Fire, and, like a Salamander, live in it without any peril or hurt. This Red Salamander is one of the moſt noble Medicaments that can be prepared by Art. This Operation I performed but once; and then unto me appeared all thoſe Colours one after another, untill I obtained a Red Salamander, which is a moſt preſent Remedy againſt all Diſeaſes. But what it is able to effect in Chymiſtry, as yet I have not known, being onely content with a Medicine for Health.

CHAP. XIX.

Yet another way of extracting the Tincture from Gold.

R *Ecipe* of our dried Red Bloud of *Sol*, in the form of Powder irreducible one ounce, or an ounce an half of our Sulphureous fixed *Sal mirabile*, five, ſix or ſeven ounces. Both which mixt together, put into a ſtrong Crucible; which covered, ſet into a Wind-Furnace, giving Fire ſo, as they may flow together like Water for the ſpace of half an hour: afterward pour them out into ſome Iron Veſſel, or Cone, when the *Sal-mirabile* hath drawn from the Tincture of Gold a Bloudy Colour. The Mixture cooled, ſeparate the Red *Scorias* from the *Regulus*, which will be white as *Lune*. Pulveriſe the Red *Scoria*, or tinged *Sal-mirabile*, upon which pour common Water; this Water diſſolves the *Sal-mirabile*, not indeed tinged with a Red, but greeniſh Colour. Filter the Solution, and evaporate the unprofitable Water in a Glaſs-diſh. Then in the bottom will remain a Red Salt, which fortified with the Seal of *Hermes* or Luting of *Sapience*, keep for a ſufficient time in a continual Fire of Coals: for then the Sulphur, as yet immature, will fix it ſelf with the *Sol*, and become conſtant in Fire. From that Lute of *Sapience*, you may afterward (by the help of a proper Magnet) abſtract a fixed Tincture, and convert the ſame to Medicinal uſe.

Note: That green Saline Water, in which the Redneſs is latent, coagulates *Mercury* into *Sol*, not indeed for wealthy profit, but onely by the benefit of that to know the poſſibility of ſuch a Work. The Red ſlime, whence the Salt is extracted by the benefit of common Water, muſt be taken out of the Filter, mixed with new *Sal-mirabile*, and in a ſtrong Crucible be made to flow well for half an hour. Then alſo more Tincture will be extracted, and a white *Regulus* of *Sol* again ſettle to the bottom. If this labour be a third time repeated, the Tincture will be good, and a white *Regulus* will again ſettle, yet not ſo much, as was the firſt and ſecond time.

CHAP. XX.

How by the benefit of a certain Metallick Salt, from Venus *her Son* Cupid, *or rather the true* Mercury *of Philoſophers, may be prepared in the ſpace of One Day, ſo, as to ſuſtain the Trial of a Cupel: and indeed, it is neither* Sol *nor* Lune, *but a Tincture moſt ample for certain white Subjects.*

AS for the Method of Proceeding, I have willingly offered to the Sons of Art occaſion of underſtanding That: but the thing it ſelf is of ſo eaſie Operation, as even the Forgers of infamous Libels, and all the Brethren of Ignorance, would underſtand and perform the ſame, if any One in deſcribing it ſhould give them but a very little Light. It would be an unadviſed thing to caſt ſo noble a Pearl before Swine. Wherefore I muſt forbear to write fundamentally of it. Nevertheleſs, that the World may know ſuch a Tincture is in the Nature of things, and may be prepared of Things of ſmall value; I confeſs I thought it worth while to diſcover ſomething thereof.

Recipe of irreducible fixed *Arſenick*, and of *Mercury* of *Luna*, of each eight ounces. Both which Species being diligently mixed, you will have a famous Cementing Powder, by help of which you may perfect this *Arcanum*, thus:

Recipe of Plates of *Venus* beat thin and cut ſmall four ounces, which, with the Cementing Powder above mentioned, (making Lay upon Lay, as the manner is) into a Cementing Box glazed within, the Cover of which you muſt lute very well, and place that in a Cementatory Furnace; or (if you have not ſuch a Furnace) upon a Chimney-Hearth, putting ſo many Coals round about, as the Box may be covered well. Kindle the Fire above, and heat the Box leiſurely, and keep it there red-hot among the Coals ten or twelve hours. Then let your Fire go out, and the Box cool: out of which, if you take your Cement, you will find, that the Volatile Spirits of *Luna*, taking the fixed *Arſenick* to themſelves, have introduced the ſame into the Copper Plates, and procured to it the whiteneſs of Silver. This Cement, together with the Copper Plates mixed with ſalt Alcali or burnt Tartar, melt in a ſtrong Crucible in a Wind-Furnace, and pour out the Mixture into a Cone. When cold, ſeparate the *Scorias* from the *Regulus*, which will be white as *Lune*. Cupellate this white *Venus* with *Saturn*; then that, which is not *Lune*, will enter with *Saturn* into the Cupel, but the fixed *Mercury* remain above upon the Cupel. Granulate that, and diſſolve it by the help of *Aquafortis*; then indeed the *Luna* will diſſolve, but the Philoſophick *Sol*, or rather *Mercury* of Philoſophers, will remain in the bottom undiſſolved, like an Aſh-coloured Calx. This edulcorated and reduced, paſſeth into an heavy Metallick Body; in Face, Colour, and Hardneſs very like common and known Lead, which by *Spagyriſts* is called the *Black Lead of Philoſophers*. This Black Lead hath ſuſtained the Examen of the Cupel, yet it is neither *Sol* nor *Lune*. For if it had been *Lune*, the *Aquafortis* would have diſſolved it; and if it had been vulgar *Sol*, it would have been infected with no Lead colour. Nor can it be Copper or Arſenick; becauſe if it had been ſo, it could not have ſuſtained the Trial of the Cupel. Therefore, according to the Fables of Poets, it muſt be *Cupid*, or the Son of *Venus*. When the Gods ſaw that *Vulcan*, or the Son of *Jupiter* and *Juno*, was born ſo very black and deformed, they took care to have him carried into the Iſle of *Lemnos*, that there being waſhed by Apes (that is, by Men or Philoſophers imitating Nature) he might obtain a better Form,

Form, be nouriſhed and brought up to Man's eſtate. Who afterward married *Venus*, of whom he begat *Apollo*. Whoſoever deſires farther Information touching this matter, let him read that Ingenious Treatiſe of *John Braceſcus*, of the Tree of Life; where many great *Arcanums* are revealed, and the obſcure Writings of Poets and Ancient Philoſophers explained.

Here I have in few words divulged one of the greateſt of *Arcanums*. I have not my ſelf, as yet, by trial adhibited this *Mercury* of Philoſophers, for the Tranſmutation of Metals. Nevertheleſs, as I have written, it is a very far extended Tincture for white Bodies, and this I have ſeveral times experienced; yet onely in white Glaſs: where one part of the Tincture tingeth one thouſand parts with the redneſs of a Ruby, but the Glaſs keeps its own hardneſs. Now, if it could obtain the hardneſs of a Ruby, as well as its fair Colour, ſuch a Tincture would be full as good, as if it could tinge *Lune* it ſelf, or *Mercury* into *Sol*. For a good Ruby weighing but one ounce, is more eſteemed than ſixteen ounces or a pound of Gold. But this Glaſs, with how great Beauty ſoever it is tinged, ſtill remains Glaſs, and cannot otherwiſe be uſed than to adorn certain Pictures and Images.

Note: If any one knows how to extract the Tincture from this coloured Glaſs, they will obtain a moſt excellent Univerſal Medicine. For, although this *Mercury* of Philoſophers hath once paſſed the Trial of the Cupel, yet this happened onely by help of the Silver, which defended it from devouring *Saturn*; otherwiſe it had been conſumed by it. But now it is ſeparated by help of *Aquafortis* from the *Luna*, it is deſtitute of a Defender, and is conſtrained to enter again into its Mothers Womb, that it may there be ripened, and afterward new born. For all Sand or Flint, of which Glaſs is made, is the Matrix or Mother of all Metals. Glaſs is the Philoſophers Lute of *Sapience*, or Seal of *Hermes*, with which all Volatile Mineral Subjects are ſo bound and fixed, as they can abide fixed, ſuſtaining the force of Fire.

CHAP. XXI.

How, by the benefit of the Common Lute of Sapience, Sulphur, Antimony, Arſenick, Auripigment, *and the* Sulphur *of Vegetables, may in a ſhort time be fixed into fixed Medicaments.*

Recipe any one of thoſe Subjects, which you will; which if you diſſolve either by the dry or humid way, in a ſharp *Lixivium*, the *Lixivium* ſo far conſtringeth the Volatile Subject, as it will not, when heat red-hot continually evaporate. Such a *Lixivium* coagulate into Salt: If of this Salt you mix four or five parts, with one part of a liquable Flint or Sand, and put the Mixture into a Cementing Box well luted; ſet that into a Furnace of Cementation or Fixation to be fixed, the *Sal-Alcali* preys upon the Flint, and with it is converted into Glaſs. But the Volatile Mineral hides it ſelf in this Glaſs, and is not driven thence by the violence of Fire, but ſuffers it ſelf to be fixed into a fixed Tincture. After that, which was put in, ſhall be fixed, take your Box out of the Furnace or Fixation, and make the Glaſs flow well in a Wind-Furnace. This Glaſs, when poured out, will be Red in Colour. If you reduce this Glaſs to Powder, and by the help of Spirit of VVine extract the fixed Tincture, from this fixed Subject, you will have a moſt efficacious Medicine againſt all grievous Diſeaſes, eſpecially, if the Tincture hath been extracted from Antimony, or Common Mineral (not Vegetable) Sulphur. The Tinctures of Arſenick and Auripigment, are not ſo ſafe to be uſed in Medicine, but in Chymiſtry they are more profitable. For ſuch Subjects cannot be fixed by any more eaſie Method, than is here diſcovered by me. And *Paracelſus*, *Baſilius* and other Philoſophers judge, that a Tincture drawn from fixed Sulphur or Antimony, will be admirably efficacious in Medicine and Chymiſtry.

But that I ſo abruptly break off this diſcourſe, it is not without Reaſon, for I am confident I have writ plain enough to him whom GOD favours.

Note: If to your *Hermes Seal*, you add ſuch Sand or Flints, as *per ſe* abound with the firſt Ens of Gold, you will acquire the more noble Tinctures.

CHAP. XXII.

How to prepare a famous Univerſal Medicine of Gold.

Recipe three or four Ounces of the coagulated and irreducible Bloud of the Lion; of which the little Book of Dialogues treats. Diſſolve them, in the dry way, by the help of *Sal-mirabile*, into a Red Stone; from which reduced to Powder, extract its Tincture, by the help of Alcolizate Spirit of Wine. This Tincture is a famous *Aurum Potabile* againſt many Diſeaſes. Alſo it coagulates living *Mercury* into *Sol*. I purpoſed to have prepared no ſmall quantity of this *Aurum Potabile*, that I might therewith help and ſuccour the Diſtreſs of the Diſeaſed. But I was hindred for two years, ſo as I could not attend this Operation. Now I have found an eaſier Method of preparing it, and by help of that, do hope hereafter I ſhall do more than I could doe before. Touching its ſalutary uſe in Medicine, and its Coagulation of *Mercury*, ſhall (if GOD will) be treated of hereafter, before it be long. Here the Deſcription of that would be too tedious.

CHAP. XXIII.

How a Medicinal Water may be Diſtilled from Jupiter *and* Mercury, *by the benefit of Fulmination, or a ſudden Flaming Fire.*

MAke an *Amalgama* of Tin and Mercury in equal weights: Mix this *Amalgama* with Sulphur, Tartar and Nitre mixt in equal parts, and Grind them exactly upon a Stone, and then your Matter, with its Fulmen, is fit for Diſtillation. Therefore, when you purpoſe to diſtill a Medicinal Water from *Jupiter* and *Mercury*, begin your Operation thus.

Againſt ſome Wall, ſet up five or ſix Glaſs Cucurbits, [or Subliming-Pots of Earth glazed within] one above another, ſo as they may exactly ſhut in one into another, and let the Junctures be firmly cloſed with Paper and Starch, as I taught to be done in preparing Spirit of Salt. The loweſt Glaſs muſt have an Orifice in the ſide, into which the neck of the Diſtillatory Veſſel may be inſerted. Which Veſſel muſt be made in form of a Box or Cabinet round, a ſpan broad and high; in the upper part thereof, which is to be filled with Sand, the Cover may be included

in

in ſuch wiſe, as I taught in the Second Part of my Philoſophical Furnaces; yet below it muſt not be round, but plain; ſo as ſtanding out from ſome Bench it may be fitted to the Receivers. VVhen all Junctures of the Receivers ſhall be cloſed exactly, your Furnace is compleat. Then, at one time put in no more of the Mixture into a Crucible ſet in that Furnace, than one Ounce. From this (when you have kindled it with a live Coal, and nimbly put on the Cover again) will be excited a Fulmination, and flame ſuddenly penetrating, and with great noiſe ſeparating the Mercury from the Tin; in which ſeparation, part of the *Jupiter* and *Mercury* aſcends in the form of a ſoweriſh Water, but another part in the Species of a ſubtile yellow Powder. When this Fulmination ceaſeth to fume, take out that Crucible, and put another in his place: ſet fire of the Mixture in that, and let it burn as before; and continue the ſame labour, taking out and putting in, as long as any of the Mixture is left. Then take the Water diſtilled, together with the Flores, out of the Recipients. That Water (when digeſted with gentle heat for a ſufficient time) is coagulated into a Medicinal Red Salt. The Flores muſt be dried and fixed with freſh fulminating Matter, and as before ſublimed. Then again will aſcend Water and Flores. All the other Flores remain fixed in the Crucibles, which (reduced by force of Fire and diligent Fuſion) produce an hard Tin, which may be cupellated by the help of *Saturn*, but vulgar Tin cannot bear this Examen. This leaves ſomewhat behind it in the Crucible; yet not ſo much Gold as covetous Men deſire; but ſo much as renders the Medicinal Red Salt acquirable without charge.

Ancient Poets, fabulizing touching this Work, have writ, that *Jupiter* and *Mercury* ſought entertainment of *Philemon* and his VVife *Baucis*, as Perſons contented with little, that from them they might receive Meat and Drink liberally. Let him, who deſires a more ample Information of theſe things, peruſe ſuch Philoſophers, that he may ſee how highly this Work was eſteemed by them. For, as we now ſaid, *Jupiter* and *Mercury* turn not into rich and proud Men, (who regard not Art, but thirſt after heaps of Gold, by which they may long continue their Pride of life) but to the Lovers of Frugality onely, and into their Houſe bring their own Bleſſing with them.

CHAP. XXIV.

The way of extracting an Univerſal Medicine from common and well-known Lead.

BY Calcining reduce four pound of Common Lead to Aſhes. With which four pound of Calx of Lead, mix four pound of thoſe Stones or Sand, in which is contained the firſt Ens of Gold. Melt this Mixture in a ſtrong Crucible into Glaſs: which reduced to Powder, mix with a fourth part of Salt of Tartar, and in an Iron Crucible reduce it, ſo you will recover almoſt all your Lead. This Lead again reduce to Aſhes, and mix with it a fourth part of choice Sand and Flints, and melt the Mixture into Glaſs. VVhich again reduce by help of Salt of Tartar and Iron: again Calcine it, with Flints turn it into Glaſs, and reduce it as before; the oftner the better. For in every Operation the Lead extracts ſomething of the firſt Ens of Gold from the Sand or Flints, and at length becomes very rich with it. That afterward muſt, by the help of a certain Magnet, be extracted from the Lead, and converted to Medicinal uſe; as every Man, according to his capacity, is beſt able to uſe the ſame. I judge it not convenient to make a farther diſcovery touching this matter. Indeed the external face of this Proceſs is ſimple; becauſe in ſo ſhort a time, with ſo little charge, and from ſo vile ſubjects, an Univerſal Medicine may be extracted. Although *Saturn* is covered with a deformed Aſh-coloured Coat; yet within in his interior penetrals is reconded a golden Crown, which is not perceived before that grey Habit is taken off from him. As oft as any one hopes for, or thinks to obtain ſuch a thing, let him read what *Baſilius*, *Paracelſus*, and other Philoſophers have writ touching Lead. Bleſſed is that Man, who knows how to adhibit to this Operation the Secret Lead of Philoſophers inſtead of Common Lead: for then undoubtedly he will find a moſt excellent Medicine; according as Ancient Philoſophers, by the following Words have expreſſed:

Arctus eſt Hominis, qui conſtat VI. Elementis,
Cui P. ſi addideris, S. in M. mutare benè ſcis,
Hoc erit Æs noſtrum, conſtans Lapis Philoſophorum.

That *Arctus* is *LUMBUS*, before which word, if you ſet the Letter P, and change the laſt Letter S, into M, it will be *PLUMBUM*. Therefore if by the help of Common Lead, (which notwithſtanding is very impure, and as it were Leprous) the poſſibility of Tranſmutation may be demonſtrated and verified, as is manifeſt by my New Chymical Light, what may not the Secret Lead of Philoſophers effect, which is *per ſe* pure, and more excellent than Gold? *Coſmopolita* ſpeaks thus: Although unto him, to whom GOD hath ſhewed the poſſibility of that, the Gain be not ſo great as the Loſs, yet unto him is opened an Entrance to the knowledge and finding of all other high things. More of theſe at this time I forbear to ſpeak. Whoſoever is ſo groſs and ſtupid, as he knows not how to enter through this Gate ſet wide open, how ſhall he be able to enter through a narrower paſſage? Him, to whom this clear Light cannot ſhew the way, neither the Light of *Sun* or *Moon* will profit any thing. Yet I doubt not, but that even Mechanick Artificers, ſo ſoon as that my Light begins to ſhine, will ſearch out the Truth, unto every of whom I wiſh the help of GOD.

CHAP. XXV.

How Gold may be rendred Volatile, ſo as to be ſublimed into a ſalutary Medicine.

DIſſolve as much Common Salt in *Aq. Fortis* as you can, in this *Aq. Regia* diſſolve *Sol*, which precipitate with Spirit of Urine. In Sand abſtract all the Phlegm to a dry Salt; if afterward you augment the Fire, the Coagulated Spirit of Urine will carry up with it ſelf part of the pureſt *Sol* in the form of a Red Salt. This Salt will yield very profitable Fruit in Medicine. The Doſe is from three, ſix, eight, to twelve Grains; endued with power of expelling Sweat and Urine, and famouſly conducent againſt the Stone and Gout. Alſo ſince this Salt is void of any loathſome Taſte, it may ſecurely and commodiouſly be adminiſtred as a Cathartick to Infants, and Women with Child.

CHAP.

CHAP. XXVI.

The Way of preparing yet another famous Medicine Univerſal of Gold.

Diſſolve one part of Nitre, in four parts of Spirit of Salt, diligently rectified. In this Water diſſolve as much Gold as you will. Upon this Solution leiſurely at times, and drop after drop, pour on of Oil of Tartar ſo long, as untill both thoſe contrary Natures of the *Aq. Regia*, and Oil of Tartar, ſhall be united and quiet. Then, if you abſtract all the Phlegm, with the *Sol* will remain a Salt. This Salt, with the Gold, put into a little coated glaſs Body; yet firſt mix with them of burnt Bone as much in weight, as the Salt and *Sol* did weigh. The Bones are onely added, that the Gold may not be ſeparated from the Salt, or be precipitated into a Maſs and flow. Place the Glaſs, with this mixture, in Sand, augmenting the Fire gradually, untill the Glaſs in the Sand be obſcurely Red; in which degree of Fire, if you detain it the ſpace of ſix hours, the fuſible Salt will penetrate the hard Gold, and from it extract its beſt ſtrength, and thence wax Red. Which, when all is cold, take out of the Glaſs, and by the help of Spirit of Wine extract from that Red Salt all its Tincture; which you may adminiſter in grievous Diſeaſes, according as your Judgment ſhall inform. If you reduce the extracted Gold by the help of Borax, you will find your Gold pale.

The Way of Extracting a yellow Tincture from white Nitre.

By Retort diſtill a ſtrong Spirit from pure ſalt Nitre, mixt with burned Earth. Which Spirit, leſt it ſhould not be ſtrong enough, dephlegmate. This Spirit in Diſtillation aſcends Red, but when cold appeareth White; yet in it is abſconded a Redneſs, which will be revealed the following way. We ſee that if any thing fall from thoſe, who labour about *Aqua Fortis*, into it (whether that fallen in be a piece of Skin, Hair, or any part of the Nails of the Fingers) the ſame is tinged thereby with a golden Colour. The reaſon of this Colouring is this: All ſuperfluities of Nature (as the Skin, Nails of the Hands and Feet, all Hairs and Hoofs of Animals, and Feathers of Birds; which being old, fall off, and new ſucceed in their place) are endued with power of cleanſing the Humane Body, whenſoever they are prepared for Medicinal uſe; and that by reaſon of the abundance of Volatile Salt contained in them, and other ſuch like Entities. For Volatile Salt is of ſuch a Nature, as Salt of Urine, by which all corroſive Spirits are mortified and edulcorated. Hence it is, that when one drop of a Nitrous Spirit falls upon the Skin, or a Nail of the Finger, it is mortified and diſcovered by ſuch a Volatile Salt as lay hid in it; which otherwiſe happens not in all other Subjects, which are void of ſuch a Volatile Salt.

Now follows the Proceſs.

Recipe of the Hairs either of a ſound Man, or of any Animal, very well waſhed and cleanſed from all filth, four ounces. Upon theſe pour of moſt ſtrong and well rectified Spirit of Nitre, one pound, and the Spirit will totally diſſolve the Hairs. Upon that Solution pour by degrees ſo much Oil of Tartar, as untill all the Spirits of Nitre be mortified and totally deprived of their Corroſive power. But you ſhould not ceaſe to pour on Oil of Tartar, untill the Spirit hath well acquired a Golden Colour. This being ſeen, filter the Solution through brown Paper, in which the Fæces will remain, which notwithſtanding will ſcarcely weigh half a dram; becauſe the Spirit of Nitre hath almoſt diſſolved all. If from this Liquor in a Glaſs-body ſet in *Balneo*, you abſtract all the unprofitable Phlegm, in the bottom will remain a Red Salt; on which, if you pour good Spirit of Wine, ſome Fæces will again be left in the bottom, which you may caſt away as unprofitable. Moreover, if one half of that Spirit of Wine be abſtracted from the Tincture, a yellow Oil is acquired; which if you rub upon good Silver, that will look as yellow as if it were good Gold. If you ſhall take of this Tincture, although it is ſo Volatile, from three, ſix, nine, to twelve drops, it ſtrongly expells Sweat and Urine, cures the Jaundies, yields relief in the Dropſie; in Feavers it provokes Sweat, and in the Peſtilence or other Diſeaſes, where Sweating is needfull. I attempted to fix this Tincture; but it was an Operation of no ſmall time; therefore I was weary of proceeding, and abſolving the Work begun. If any one be ſo patient as to fix this Tincture, he, after his Work is ended, will have whereof to rejoyce. Touching this Operation, Philoſophers feigned the venomous Dragon to be a watchfull Keeper of the Golden Fleece; and that the ſame could not be taken away before the Dragon was brought to ſleep by a Soporiferous Medicine, by which he ſhould be rendred inſenſible and fixed. But undoubtedly ſome opinionative Men will ſay, that this yellow Tincture is acquired from the Hairs, Wool, or Feathers, rather than from the Nitre. The Opinion of ſuch Men I thus refell. If any one diſſolve Hairs, Wool, or Feathers, by the help of Spirits of Salt, Sulphur or Vitriol, he will acquire a white Solution: and if he mortifies the Spirit of Salt or Vitriol with Oil of Tartar, yet ſhall no yellowneſs appear, but all remain white. And ſuch white Salt, which comes from the Spirits of Salt and Vitriol, hath alſo its uſe in Medicine. The reaſon of that is eſpecially, becauſe Hairs in themſelves contain a very Medicinal Salt, which cannot poſſibly any other way be obtained, than by diſſolving with the help of *Aqua Fortis*, or of their re-mortification and reduction into Salt by the benefit of *Alcali's*.

After this manner from many Animals, by the help of Spirit of Nitre, may be extracted yellow Tinctures or Salts, which are very efficacious in Medicine.

Such Caſt-skins of Serpents, as are commonly found in Fields, and among heaps of Stones, are famouſly Medicinal againſt Poyſons, the Peſtilence, and all other venomous Diſeaſes.

The Teeth of Serpents, and Teeth of Mad Dogs and Wolves, have a Medicinal Efficacy againſt all venomous Bitings of Animals. Alſo they help the Stomach againſt all Feavers.

Scorpions, *May-Worms*, *Cantharides*, and ſuch like venomous Inſects, do all miniſter yellow Tinctures, or ſuch Salts as may moſt profitably be adminiſtred in all grievous and venomous Diſeaſes.

CHAP. XXVII.

What is to be judged of the Tincture of Corals.

WHen *Paracelſus* writ of the admirable Virtues of *Tincture of Corals*, which it manifeſts in the Expulſion of all grievous Diſeaſes, he ſaid, that very many famous Men endeavoured to perfect that Tincture; but an happy event or proſperous ſucceſs of the ſame happened to few. Even ſo hath it happned unto me, who have been a ſearcher of that Tincture above forty years. As to the external face, I could indeed variouſly extract a Tincture of Corals, but in Medicine it proved not as it ſeemed. Hence I conjectured that was not the true Tincture of Corals, but that Tincture came from the *Menſtruum*. Yet at length GOD ſhewed me ſome particular Feathers of Birds, which might be adapted to fixed Tinctures latent in Stones and ſtony Subjects, and by help of them the ſame be extracted from their groſs Bodies, and expoſed to publick view; yet among them all, three ſorts of Feathers onely hold the Principal place.

I.

The black Feathers of Crows,

which are endued with power to elevate ſuch Tinctures as love to aſcend.

II.

The white Feathers of Pidgeons,

which, in a ſort, contain in themſelves the pureſt, and before (by their natural virtue) lightly volatile Tinctures, invade and carry them upwards with them.

III.

Eagles Feathers,

which rowſe even the moſt fixed and heavieſt Bodies, and thence extract the inmoſt or nobleſt part of them, and carry it upwards with themſelves.

Yet theſe Eagle-Feathers are moſt commodiouſly uſed for extracting of fixed Tinctures from fixed Metals and Stones. For if they be applied to other very Volatile Subjects, they will carry up with themſelves the whole mortified Body together with the Tincture. Therefore, whoſoever would by the benefit of the Salt of theſe Feathers, or of the Salts of other Volatiles, perform ſome excellent Work, let him exactly learn the difference between one and the other. But ſince here I onely intend the Extraction of the Tincture from Red Corals, there is no need of any other Feathers for that purpoſe, but of Pidgeons Feathers onely, becauſe they will be ſufficient for this Operation.

The Feathers or Wings are thus found and acquired.

Diſſolve one pound of pure Silver in *Aqua Fortis*. If to this Solution you pour good Spirit of Salt, in which Common Salt is diſſolved, all the *Luna* will be precipitated from the *Aq. Fortis* in the form of a white Calx In which Precipitation the Silver acquires the aforeſaid white Pidgeons Feathers from the Salt-water, and ſubmergeth them, together with it ſelf, in the bottom of the Veſſel. In this Precipitation alſo the *Aqua Fortis* periſheth not, but paſſeth into good *Aqua Regia*. This white Calx of *Lune*, which I have owiſe called *Mercury* of *Lune*, if it be diligently edulcorated and dried; then are the Feathers prepared, by help of which I here teach how the Tincture of Corals is to be extracted.

Recipe one pound of Red Corals, grind them upon a Stone to a moſt ſubtile Powder; to which add as much of this white Silver Calx alſo pulverized. Put theſe together into a Glaſs-Retort, adminiſtring Fire by degrees, untill the Retort be red, whence (before it is red-hot) will aſcend a reddiſh Water pleaſantly ſweet; out of one pound of Corals, about four or five ounces Let this Water be dephlegmated in a ſmall Glaſs-body, by gentle heat of *Balneo*, and the unprofitable Water ſeparated from the Tincture; which every Man may ſafely uſe in Medicine according to his capacity and skill; becauſe by virtue of it the Bloud is egregiouſly purged. Almoſt after the ſame manner, by help of theſe Feathers, a moſt efficacious Water of Pearls may be diſtilled from fragments of Pearls, or in defect of them from Mother of Pearls.

Likewiſe, by their help, from a certain peculiar kind of white Talk, may be extracted a famous Coſmetick for whitening the black Skin.

Alſo otherwiſe by the help of theſe, from Vegetable and Animal, as well as from Mineral Subjects, many famous Medicaments may be extracted; all the Preparations of which, if any Man ſhould take upon him to deſcribe, he would above meaſure encreaſe the Volume of his Book: which is not my purpoſe now to do. Therefore with theſe already commemorated every well-meaning Man will hold himſelf content. Hereafter (if GOD pleaſe) we may diſcover more.

That which remains in the Retort take out, mix it with an equal weight of burned Tartar, and then by ſtrong fire melt the Mixture. Then the *Lune* will precipitate it ſelf into a *Regulus*, and the Corals, Pearls, or whatſoever you diſtilled by the help of that, will paſs into *Scorias*. If you rightly know how to operate this, you will loſe none of the Silver. But if you granulate the ſame, diſſolve it in *Aquafortis*, and again precipitate it with Spirit of Salt, edulcorate and dry the Calx, you will have new Feathers, by the benefit of which you may ſublime ſubtile Tinctures from Bodies. The reaſon why theſe Tinctures aſcend ſo ſweet, is, becauſe the ſharp Spirits of Salt, which the *Lune* detains with it ſelf, adhere to the Corals and Pearls, and mortifie themſelves with them, and upwards onely drive a ſweet Eſſence.

Since I have ſaid ſomething of White Pidgeons Feathers, and alſo made mention, that many other ſuch Feathers may be had, by which heavy Subjects may in like manner be elevated, and carried upward with them; among which the Dark-coloured Feathers of the Eagle do eaſily obtain the priority; I thought it would be worth while to ſhew the way of Acquiring them here alſo; which thus take.

CHAP. XXVIII.

How a Medicine may be prepared of Sol *and* Luna *together.*

RAcipe of Gold one ounce, and of Silver two ounces. Diſſolve the *Sol* in *Aqua Regia*, and the *Lune* in *Aqua Fortis*. If you mix both Solutions together, one Metal will precipitate the other, and both ſettle to the bottom in the form of a Dark or Aſh-coloured Calx. This Precipitate edulcorate and dry, and

and mix with the ſame half its own weight of our Eagles Feathers Diſtil theſe in a Glaſs Retort with ſtrong Fire: then will the Eagles Feathers take up with it ſelf a white Water; in which, notwithſtanding, is latent a red Tincture; but of an unpleaſing Taſte, and therefore not to be adminiſtred in medicinal Practice. Yet, if this fierce and horrible Water be mortified by the help of a *Lixivium* of Tartar, and afterward ſome white Glaſs broke ſmall be melted in a Crucible with ſome ſuch Salt, the Glaſs will be tinged by the Salt, with an eminent yellowneſs anſwerable to the Colour of Gold. That yellow Tincture may be extracted from the Glaſs, and uſed in Medicine; becauſe it ariſeth both from *Sol* and *Luna*, and therefore neceſſarily muſt be medicinal.

Note: That during the Diſtillation, the Glaſs veſſel contracts divers Colours, partly red, and partly yellow; *viz.* as long as it ſtands in the Fire and is hot; but the Neck remaining out in the Air, continues white. Here is cauſe indeed of admiration, that by that mixture of divers Colours many and various Figures are repreſented, as Mountains and Valleys, adorned with Rocks and Trees, ſo artificially, as they ſeem to be the Work of a Painter. Some ſuch Glaſſes painted, both by Art and Nature, I gave to ſome of my curious and ingenious Friends; who I believe have them yet to ſhow. Theſe Glaſſes are tinged well and throughly; ſometimes through their whole Body, and that ſo firmly, as even the ſtrongeſt *Aqua Fortis* or *Aqua Regia*, or any Corroſives cannot take off thoſe Colours. Which indeed is a moſt ſtrange and admirable thing, that even vulgar and corporeal fixed *Sol* and *Luna* ſhould be rendred ſo volatile, as to be able to enter into the compact Glaſs, and tinge the ſame. Spirits have great power, are void of ponderoſity, and when they tinge, the vertue of them is diſcerned far: even as the Spirits of men and other Animals are void of all heavineſs or weight; which we clearly diſcern by this, *viz.* that a man living, is much lighter than when he is dead.

Moreover, Spirits cannot onely render fixed *Luna* volatile, and reduce it into red Bodies as *Sol* and *Venus*, which without any hurt of their form, and without increaſe or diminution of their weight, they can totally tinge with whiteneſs; but alſo Spirits can render the moſt fixt and moſt compact Gold volatile, and induce it into compact *Lune*, whereby that ſhall be tinged with yellowneſs, which is a thing very wonderfull. But that Spirits can induce Tincture into Glaſs, without hurt or augmentation of its weight, deſerves greater admiration; eſpecially becauſe it is the common Opinion of putatitious Philoſophers, that in Glaſs are no pores, yet the contrary of their ſuppoſition is true. For if it were ſo, as they perſwade themſelves, which way I pray could Tinctures be introduced into them?

Note: That Spirits do not onely induce Metallick ſubtile Tinctures into compact Metals and Glaſſes; inſomuch, as by the help of white Spirits, yellow *Sol*, without deſtruction of its form or ſpecies may totally be tinged with whiteneſs; and white *Lune* by the mediation of red Spirits, be totally tinged with yellowneſs, and white Glaſs with various Colours reſembling the Beauty of Jems: but they alſo extract fixed Bodies from other fixed Metallick Bodies. As we ſee, as often as we caſt any mixture of *Sol*, *Luna* and *Venus*, (melted into a Maſs) into thoſe Spirits; the ſame Spirits extract the *Luna* and *Venus* from the *Sol*, without corruption or deſtruction of its form, ſo as the *Sol*, although this ſeparation is made, doth notwithſtanding remain compact and maſſy. We have ſuch Spirits as theſe in our Poſſeſſion, and can render the ſame fit for our purpoſe.

As for all other Spirits, which are various; *viz.* 1. Are Cœleſtial and Divine. 2 Terreſtrial and Diabolick. 3. The Spirits of the four Elements; theſe excel the former in power: for they cannot onely paſs through Doors that are ſhut, but alſo through the hardeſt Stones and Rocks, and there at pleaſure ſport and perpetrate wonderous things. As you may learn from thoſe that labour in Mines of Metals, where ſuch Spirits inhabit, and ſtoutly defend their Treaſures of Gold and Silver, from ſuch as come to ſpoil them of the ſame; wherefore they invade the Miners, ſtrike them, pault them with Stones or Dirt, blaſt them with venomous Vapours, and oftentimes kill many of them at once. What wonderfull things they in theſe ſubterranean Manſions are able to effect, is more than ſufficiently known. In the Mansfieldick Mountains of *Venus* or Copper, the Spirits paint all kind of Figures, eſpecially of Fiſhes; ſome of which I my ſelf have ſeen. About 100 years ſince there was dug up a certain Image of *Venus* upon a black Fiſſile Stone, wherein *Luther* and the Electour of *Saxony* were ſo evidently expreſſed, as either of them might be ſeen kneeling before the Image of Chriſt crucified. Alſo another ſuch Fiſſile Stone was thence dug up, in which was exactly figured *John Baptiſt* baptizing Chriſt in *Jordan*. But if our Spirits of Salt can induce Tinctures into the compact Bodies of Metals; and Elementary Spirits in their ſubterranean Habitations, can impreſs many and various Figures on Stones; what is that good Cœleſtial Spirits ſhall not be able to effect? Did not theſe preſerve the three Children in the *Babylonian* Fiery Furnace? Did not they bring *Peter* out of Priſon; and the Prophet *Habacuck* to *Daniel* into the Lyon's Den? Are not they able to bring in, and lead out? Cannot they render fixed palpable Bodies volatile, ſpiritual and inviſible, and on the contrary render inviſible Bodies viſible and tangible?

Many things might here be ſpoken touching the Nature, Property and Difference of Spirits, but that they are not pertinent to our preſent purpoſe. If GOD permit, according as I have purpoſed, I ſhall ere long ſet forth a peculiar Treatiſe of Spirits. Here we have heard how Spirits can bring through ſhut Doors hard Bodies, and there render them corporeal and viſible. Which may ſerve for Information to every Searcher into the Light of Nature.

CHAP. XXIX.

Yet one other Specimen *of Probation by the help of Eagles Feathers.*

THAT Artificer *Lazarus Ercker*, moſt famous for finding out the Veins of Metals, in his Book of Probations (or of finding out Veins) relates, that the *Venetians* hired certain men for wages, and ſent them into *Germany* to gather of the glaſſy dark coloured Grains of Sand of the Rivers running by the Mountains, and to tranſport it to *Venice*. The ſame is done at this very day. And although this Exportation is prohibited by Law, yet they deſiſt not, but clan-

clandeſtinely proceed. The common People of thoſe parts perſwade themſelves, that Grains of Gold are contained in thoſe Sands, and therefore by Edict every man is forbid, either to remove it thence, or to convert the ſame to his own uſe.

Indeed *Lazarus Ercker* added, that he had ſubjected ſuch Grains of Sand to various Trials, but never found Gold in them; yet that he alſo underſtood, that the *Venetian* Artificers prepared of that Sand ſuch beautifull Colours, as with them were in more eſteem, than Gold it ſelf. But I affirm, that *Erckerus* did not rigthly know thoſe Grains of Sand. For indeed there is little corporal Gold in them, but much ſpiritual Gold. If to thoſe Sands the Eagles Feathers be added, they will carry upwards with themſelves much ſpiritual Gold, which will be very conducent in Medicine. Such Grains are found in all the Sands of Rivers in all Regions of the World, and in the Gravel on the Shores of common Navigable Rivers: whence much good may be gained. Now theſe may ſuffice to be ſpoken touching the Eagles Feathers, for it is not convenient to divulge more.

CHAP. XXX.

Yet one Royal Medicine of Vulgar Gold.

MAke one Ounce of Gold more or leſs, irreducible by the benefit of Salts. Then to ſuch irreducible or unmeltable Gold, add as much by weight of the fixed Salt of the Eagles Feathers burnt. Put theſe into a firmly coated Glaſs, and place the Glaſs in an Earthen Pan full of Sand; which Pan ſet in the Fire that it may be red hot. But after it hath ſtood in ſuch a Degree of heat, for four or five hours, let it cool. Then take your fixed *Sol* out of the Glaſs, and it will be like white Chalk. This white *Sol* taken out of the Glaſs put into a good Crucible, upon which lute another, and then ſet it in a Wind Furnace, where having ſtood four or five hours, without any extream heat, let it cool. Then your Gold will be tranſmuted into a Tincture intenſly red. Grind this red Salt to a moſt ſubtil Powder, and pour on Spirit of Wine to extract his Tincture. The tinged Spirit pour off, and pour on other, that it may alſo extract. Abſtract the Spirit of Wine from the Tincture, and in the bottom a red Saline Liquor will remain, which is to be accounted a true *Aurum Potabile*: becauſe it is not poſſible by any way whatſoever to extract any Gold from thence. This Operation begun, I once abſolved without Errour; but many times afterward trying my Work, did not ſucceed ſo proſperouſly as at the firſt time. Yet I rather aſcribe the Errour to my ſelf, than to Art, plainly judging, that no other way more ſwift, more eaſie or more preparable, can be obtained a moſt readily profitable Tincture for diſeaſed, humane and metallick Bodies. Yet I add this. If thou ſuffereſt the common and now ductile *Sol* to be and remain Gold; and ſparing labour and charge for making it irreducible, do onely make choice of ſuch Stones for your Operation, ſuch as without Charges you may get, and by nature partake of irreducible Gold. Then indeed you may much more eaſily find what you intend. For whatſoever Tinctures of a golden Diſpoſition are incited in thoſe Stones, they notwithſtanding in this operation loſe it, altogether wax white, and at length totally red again. Which being beheld by me, I never ſaw in all my Life a more wonderfull Sight. Hence Philoſophers have always ſaid: Whoſoever can ſo deſtroy vulgar *Sol*, as it can never be again reduced into *Sol*, he hath attained to a very great Myſtery. Alſo they further ſay: Whoſoever knows not how to make our *Sol* (which is vulgar *Sol* rendred irreducible, or ſuch as hath not yet felt the force of Fire, and in Stones is by Nature irreducible) white, he alſo cannot make it red. But now that is done this way. Therefore you need not doubt that beſides medicinal Remedies, ſome other Eminent Works may thence be made. Which I leave more deeply to be ſearched into by thoſe, who are yet ſtrong and able to endure labour. As for my own part, I eſteem the Pleaſures and Riches of this World to be worſe than nothing; and ſeek onely Incorruptibles, which can neither be ſtolen by Thieves, nor gnawn by Moths and other Vermine, nor be deſtroyed by any force of the Elements.

An Admonition.

IN this little Book, candid Reader, I have treated of many rare *Arcanums*, or Secrets not vulgar; and that very briefly. All I here write, I write from certain Experience, as to Medicine: far be it, that I ſhould profeſs my ſelf a Maſter in the Melioration of Metals, I had rather ſay with *Socrates*, *This one thing I know*, viz *that I know nothing*. Indeed had I been a younger Man, I ſhould ſcarcely have forborn to exerciſe my ſelf in ſuch an Operation; but my great Age having rendred me unfit for all Labours, and unable to do any thing, I may eaſily be excuſed, for I am as it were compelled to abſtain from ſo great a Work.

Here in this Book I have treated of divers ſecret Fires, yet not of all to me known, but of many of them: touching the beſt of them all (if GOD permit) the ſeventh Part of my *Spagyrical Pharmacopœa* ſhall treat. The wonderfull Vertues of which ſecret Fires is ſo far beyond belief, as they exceed all the Fires in this Enchyridion commemorated.

Quantum Lenta ſolent inter Viburna Cupreſſi.

I am amazed, as often as I call to mind, how immenſly vertuous ſuch fiery truly Stygian Spirits are, which are endued with a faculty of mortifying all Metals (although they be Bodies of greateſt ſtrength) and of carrying with them their immortal Souls, whereſoever they can. For they are endued with ſo great power, as nothing is able to defend it ſelf from them. Yet beſides theſe there are alſo other horrid Spirits made by Art, which do not onely after Mortification take from metallick Bodies their Soul; but alſo are endued with ſo great power, as they take away the Body with the Soul. Spirits of this kind are not uſefull for our neceſſities, but thoſe Spirits which do onely mortifie the Body, and draw forth from it its Soul, leaving the groſs Body. If theſe Bodies were as conducible to us as Spirits, there would be no need to extract from them their moſt pure Spirits or Souls, to prepare our Medicine of them. Wherefore we, not without good reaſon, by the help of Artificial Diſtillation) extract the moſt clean Souls of Metals from their rude Bodies. For, by the benefit of Diſtillation, all Bodies of Vegetables, Animals and Minerals, are purified and ſubtilized. Which clean and ſubtil Spirits (when they are again reduced into fixed Bodies) muſt needs be better

Bodies

Bodies than all other vulgar Bodies, which never yet were Spirits. Therefore, the more fixed thoſe Bodies are rendred, and the more thoſe Spirits are ſubtilized, the more pure and further powerfull Tinctures will be obtained from them. The like we underſtand by Elementary Spirits. Theſe Spirits, by their proper Virtue, can ſo far extend themſelves, as to become wholly inviſible, and (if I may ſo ſpeak) altogether perviſible: on the contrary, they can again concentrate themſelves, and conſtringe themſelves into a very narrow compaſs, and in ſuch-wiſe aſſume viſible Bodies, palpable and hard, as they pleaſe themſelves. Although ſuch Objects, in the Judgment of the Eyes, are accounted Bodies, yet in very deed they are not true Bodies, but are onely concentrated Spirits, which enjoy a perpetual power of extending themſelves again into latitude, and of leaving their corporeal Form and Shape, and re-aſſuming their Spiritual Figure. But it is impoſſible that theſe extended Spirits ſhould poſſeſs ſo great power, as they had before Extenſion. For Spirits extended are no other than Air and Wind. On the contrary, concentrated Spirits have incredible Fortitude, penetrate more ſwiftly, and are Bodies of very great potency. A common Body cannot penetrate into another, without hurt to it ſelf; nor in that extend it ſelf, becauſe of its groſs and hard Maſs. Yet ſuch a Body, as is made of a certain Spirit, can penetrate other Bodies, and amend the ſame, without deſtruction of their Form and Species. As for Example: If any one turns a fixed Metal into a ſubtile Spirit, and this Spirit again reduceth into a fixed Body; this Body will not be a common, compact, groſs or mortified Body, like all other Metallick Bodies; but is a Body ſpiritual, living, penetrating and vivifying mortified Bodies; or is (as I may call it) a Corporeal Spirit, which can extend it ſelf in Amplitude, and ſhew its potency an hundred or a thouſand ways; according as all true Philoſophers aſcribe to their Univerſal Medicine or Tincture, that it, in a very ſmall quantity, is able to tinge or meliorate a great quantity of the more vile Bodies into Bodies moſt noble. Which admirable Correction is not as yet known to me; yet I certainly believe and judge, that ſuch a Tranſmutation, or famous Emendation of Metals may be made, by the benefit of concentrated and fixed noble Metallick Spirits. Whoſoever hath Time and Place convenient to ſet about this Work, may try what is poſſible to be performed by the help of Art. Convert fixed Bodies into ſubtile Spirits, and reduce volatile Spirits into fixed Bodies, then ſhall you obtain whatſoever you can deſire or wiſh for.

Indeed I have Reaſons enough to reſtrain my Quill from a farther promulgation of ſuch high Matters; yet ſince I have proceeded farther in this diſcovery, than any Man before me ever did; what hinders but that I may to the Horſe man, to whom I have given a *Niſæan* [or excellent] Horſe, give the Bridle alſo? Therefore it pleaſeth me to reveal yet one kind of Spirits, which very lovingly receive the Souls of Metals (after their Bodies are mortified) and carry them up into the Philoſophick Heaven, that is, into the *Alembick*. Which good Spirits are not horrible and cruel as the former, but ſweet and amicable. Indeed, ſuch good Spirits do not willingly aſſociate themſelves with the Souls of all Metals promiſcuouſly, but onely with ſuch moſt pure Souls, as are in *Sol* and *Luna*. But if they be compelled to be concerned in the Mortification of fœtid groſs Metals, as *Mars* and *Venus*, or of venomous, and as yet immature and volatile Metals, as *Jupiter*, *Saturn* and *Mercury*, and to receive the out-paſſing Souls of them; they refuſe not this office, yet from ſuch fœtid Souls they contract a ſtink to themſelves, and therefore can ſcarcely afterward be Medicinal. Wherefore, it is better not to uſe theſe good and pure Spirits, unleſs for receiving the Souls of clean Metals; for then they remain good, and cannot be adminiſtred in Medicine without admiration: and, on the contrary, the Souls of venomous Metals may be ſo much the more happily uſed for the Emendation of Metals.

Now, as touching theſe good Spirits, know, they are nothing elſe but a pure Spirit of Wine, when it is aſſociated with *Sol* and *Luna*, at that very time, wherein their fixed Bodies are invaded and mortified by their Enemies, and their pure Souls ſet at liberty; then they are received and carried upwards by theſe pure Spirits; and a Royal Medicine is obtained, which every Man may adminiſter according to his underſtanding. There are alſo many other Spirits which attend Metals deſtroyed and mortified, that they may take to themſelves their pure Souls and carry them away. But of theſe enough at this time. Ere long (GOD willing) I ſhall ſpeak more at large of theſe in the Seventh Part of my *Spagyrick Pharmacopœa*.

O moſt High GOD, *the One onely Beginning and End of all things, I making ſupplication from the bottom of my heart deſire, that (when that general Deſtroyer of Humane Bodies ſhall come and deſtroy my lean and dried Earthen Maſs, according to thy divine Will, and ſet my Soul at liberty from the Bonds of the Body) thou wilt be pleaſed in that very hour to take compaſſion on me, and ſend thy Miniſtring Spirits the* Holy Angels *(by reaſon of thy Grace and Fatherly Mercy) to me at the hour of Death, that receiving my departing Soul, may humbly proſtrate it at the feet of thy moſt Holy Majeſty.* Amen.

The End of the Sixth Part.

THE SEVENTH PART OF THE Spagyrical Pharmacopœa.

In which is farther treated, how of Man's Urine may be prepared the Secret *Sal-Armoniack* of Philoſophers, and what incredible Works may be performed by the benefit of it, both in Medicine and in Alchymy: With an Inſtruction annexed how an Univerſal Medicine and true Tincture for Humane and Metallick Bodies may be acquired; and that no way more eaſie, more expeditious and leſs chargeable, than by the help of good Spirit of Wine, or inſtead of that a burning Spirit extracted from Corn, or other Vegetables.

The PREFACE to the READER.

Well-meaning Reader,

THE principal Reaſon which moveth me here in this ſmall Treatiſe (without any reſpect or regard of Perſons worthy or unworthy) ſo evidently to reveal and publiſh to the ungratefull World the Secret Sal-Armoniack *of Philoſophers, is this: namely, becauſe, by reaſon of my old Age, I have now one foot in the Grave, and am ready to depart this World, and do patiently expect a far more excellent Manſion prepared by God. I, who now diſcover this Secret* Sal-Armoniack, *do alſo here intimate thoſe vaſt benefits, which (by the help of that) may accrew to Mankind, accounting great Works of Mercy may be done by it; becauſe it is that, by the benefit of which, all things neceſſary for Life may be acquired by all Men, whether young or old, poor or rich, as in the following Praxis ſhall largely be demonſtrated.*

That Men (if they themſelves will) may gain much, yea as much as they pleaſe, by the benefit of this my free and ample Revelation of ſuch an ineſtimable Salt, *I am eaſily able to prove: eſpecially, ſo ſoon as I, in the following Praxis, ſhall exhibit a* Specimen *of thoſe Subjects, the abundance of which is in all parts of the World, every-where offered, no leſs to the Poor, than to the Rich, without any expence of Money, or other Charges; but it is known by very few, privily hated by that proud Step-Dame the World, trod under foot, and for its exterior vileneſs caſt out upon the Dunghill, and thrown away in the corners of Streets.*

But, ſome One may ask, how thoſe needy People can from Urine onely, acquire things neceſſary for Life, although they ſhould know, that in it is contained a Treaſure? To ſuch an One I thus anſwer: It may very well be effected, becauſe in this little Book I have explained, not onely that in it is an abſtruſe Treaſure, but alſo how it may eaſily be extracted. Inſomuch as I doubt not, but that ſome of the Lovers of the Poor will do their endeavour to extract that Treaſure from the ſame. Which being done, if the World (which will believe nothing but what it ſees) take notice of it, and finds the verity of our Aſſertion proved in Fact, then many more will uſe a like endeavour to get their living from ſuch a Subject, every-where to be had, and preparable for little or no charge. If ſuch Operators ſhall need more Urine, than they themſelves make, they muſt neceſſarily buy it of poor Families,

Families, abundance of which you will every-where find, readily deſiring to gather the ſame for their daily Bread, and to bring it to the Artiſt: that way one hand cheriſheth and helpeth another. For by this means every Re-publick might be brought to a flouriſhing ſtate, ſo as no Man (unleſs he will himſelf) needs to want Bread in what part of the World ſoever he lives. I indeed have not buried in the Earth my five Talents gratiouſly granted to me by God, but have put them into the publick Bank. What if the mad and blind World will neither ſee nor hear, it may for all me follow its own deſperate humour. It is ſufficient for me that I have divulged ſuch Myſteries for the ſafety and well-being of Mankind, as no other Philoſopher before me hath ever diſcovered the like. For ſince the Subject is ſo very vile, vulgar and obnoxious to vaſt contempt and hatred among proud Fools, many of them did involve its genuine Name in the ſecret Cabinet of Silence. But, that I may ſpeak my mind freely, I openly confeſs and aver, that in Urine is contained a Mercury, *by the help of which very much may be effected in Chymiſtry and in Medicine; and which is eſpecially very conducent to deduce Metals to their firſt Matter; and thence may be reaped a notable Fruit of Utility, as well univerſally as particularly. For whatſoever I have now writ, I compoſed the ſame in the extremity of my diſcompoſure and ſickneſs, that this admirable Secret might not be buried with me in the Earth, where even all the higheſt Arts of the moſt excellent Artiſts ſeem to putrefie together with them, not being by them (before their Death) communicated to Mankind remaining; that ſo I may ſay with the Vulgar (not rightly underſtanding)* All Habits of Underſtanding are not ſo much hoſpited in the mortal Body, as retained in the immortal Mind.

If all things here anſwer not the deſire of the diligent Searcher of Art, or be not clearly and plainly enough diſcovered, let him look into the following Treatiſe, which is intituled, A Treatiſe of the Mercury of Philoſophers, *where perhaps he will find ſo many deſirable things, as will compleatly ſatisfie the hunger of his Mind covetous of learning. But for the ſake of the benevolent Reader, I cannot chuſe but communicate to him this Information,* viz. *that the very Inſcription of this Treatiſe diſcovers a Secret* Sal-Armoniack, *and in divers places of the Sixth Part of my* Spagyrick Pharmacopœa, *mention is alſo made of a Secret* Sal-Armoniack; *wherefore I would have you to underſtand, that the* Sal-Armoniack *mentioned in my former Book, is of a property variouſly different from this, of which I purpoſe here to write. For this is prepared of Urine, but in the preparation of that, no Urine is to be uſed; becauſe that is no other than pure Silver diſſolved in* Aquafortis, *and precipitated by the help of a ſharp Salt-water. Where it is to be obſerved, that the Silver, in ſuch a Precipitation, attracts to it ſelf ſo many Spirits of the Salt, as by reaſon of them it is no more fuſible, like other* Luna *into a Metallick Form, but becomes penetrable as Oil into a Skin. That, in my Writings, is called* the Mercury of Luna.

Note. *Of* Saturn *alſo, after this manner ſuch a* Mercury *may be prepared, which is almoſt of the ſame efficacy as the* Mercury *of* Luna; *but in ſome Chymical Labours it may not ſo ſafely be uſed as the* Mercury *of* Luna. *This muſt be neceſſarily minded by thoſe who are unwilling to err in their Labours. Moreover, touching this Secret* Sal-Armoniack, *I think it needfull farther to adviſe, that either* Sal-Armoniack (*although both are diverſly prepared*) *being added to Metals or Minerals, takes to it ſelf and carries upward the pureſt part of that Metal or Mineral. Tet it is to be underſtood, that this is effected thus,* viz. *that the Metal is corroded by the ſharp Spirits exiſtant in the* Sal-Armoniack, *and ſo is carried upward by diſtillation; or volatilized, no otherwiſe than as if you ſhould add Sublimate* Mercury *to any Metal or Mineral for extracting Butter thence. Alſo it is to be minded, that whatſoever ſhall be prepared by the help of either* Sal-Armoniack (*made with* Luna, *or with Urine*) *all that riſeth much more pure than any ſublimate* Mercury *or common* Sal-Armoniack *can cauſe to aſcend. Theſe few things I thought neceſſary to be premiſed, touching the difference of either Secret* Sal-Armoniack, *that no Man may err through miſtake.*

Although much more ſhould be ſpoken here, touching our Sal-Armoniack, *which is made of Urine; yet Time, and my preſent Condition, prohibit my inſiſting more at large thereabout.*

But that every unskilfull Man may be rendred more skilfull in the Knowledge of this Definition, it is good for him to learn, that Urine is no other than the volatile Salt of thoſe Meats and Drinks, which we receive for the nouriſhment and ſuſtentation of the Body; and which are ſo digeſted and ſeparated by the Stomach, viz. *that the Sulphur, as a ſuperfluity, is by Nature diſcharged by the Bowels; but the Urine, as a volatile Mercurial Salt, ſeeks and finds for it ſelf an Exit through the Bladder. Now, it is more than ſufficiently manifeſt, that the greateſt part of Men live of Vegetables, as of Bread, Beer and Wine; alſo for Nutriments they uſe Fleſh, Fiſh, Butter and Cheeſe: which kinds of Meat and Drink, ſo ſoon as put down into the Stomach by a certain natural Coction and Fermentation are ſo inverted, as ſome natural Mercury is thence progenited. Whence, it is clearly enough apparent, that the before mentioned Mercury (which we with the aſſiſtance of Art know how to extract out of Urine) muſt neceſſarily have been an inviſible Mercury in Vegetables,*

bles, before it paſſed into Urine, and when it was not inverted in our Body. Which is a thing moſt ſurely true, and is confirmed to us by experience, viz. *that in all Vegetables (no one of them excluded, whether Wine or Grain, Honey or Sugar, or other fat Fruits, in which our vegetable* Mercury *is moſt copiouſly abundant; alſo by what name ſoever thoſe Fruits or Vegetables are called) the ſame* Mercury *is hoſpited; yea, it may be extracted from all Fruits, Trees, Herbs, or any common Graſs of the Fields or Meadows, and from all Boughs and Leaves of wild and manured Trees, if after you have cut them ſmall, you pour on them hot water, and then ferment the ſame.*

Indeed lean Herbs, according to quantity, give not forth ſo much burning Spirit, as Corn, Wine, or Sugar: But note; Graſs is prepared with much leſs coſt than Corn, Wine, or the Fæces of Wine or Beer. Alſo a good burning Spirit may be made of Grape-Stones, or the preſſings of Grapes; yet as for the ſweetneſs of that, you need not to take any care; becauſe in operating it is ſo amended, as it is rendred full as good as the beſt Spirit of Wine that is moſt rich.

This Arcanum *of preparing a true Univerſal Medicine of all Vegetables, for thoſe three known Kingdoms of ours, I take to be as great a Secret as was ever known to Philoſophers, or for the future can be known. For it is that, of which many have notably writ, yet in ſuch a Style, as they have obſcured, involved and hid the whole Work in ſo many Parabolical, Allegorical and Enigmatical Phraſes, as it is almoſt plainly impoſſible for any one profitably to learn any thing out of their Writings, unleſs his Eyes be ſingularly illuſtrated by God. But among others,* Albertus Magnus, Thomas Aquinas, Arnold, Lully, Braceſcus, *and eſpecially* Baſilius, *have writ of it evidently enough to ſuch as can ſee; but all they writ in obſcure words: And as* Paracelſus *knew the ſame, ſo it ſeems that was alſo known to* Helmont: *yet they were afraid to write of it for their own ſakes. But I now freely and openly divulging all things, do that chiefly for this Reaſon,* viz. *becauſe the moſt wiſe God (to whom I give Immortal Thanks) revealed this Secret to me not many weeks ſince; and I, according to the weakneſs of my Age, could labour but little therein, and that very difficultly; therefore keeping my Bed, by reaſon of my Illneſs, I cauſed ſome Proofs to be made of the ſame: whence I ſo found the verity of the matter, as I am now able ſafely to confirm the ſame to others, and can aver, that the true* Mercury *of* Philoſophers *is reconded in them. Although that hath hitherto been unknown to moſt Men, yet by me (becauſe in Philoſophy, Medicine and Chymiſtry, never any thing more magnificent than it, eaſier to be elaborated, or preparable with leſs coſt, at any time before came into my hands) it is ſo publiſhed, as I doubt not, but that many well-diſpoſed Perſons will confidently, readily and happily ſet their hands to the Work. For it is eaſie to acquire burning or diſtilled Wine in abundance, without any great charge: alſo an Inſtrument made of Copper, fit for ſeparating the* Mercury *from the* Sulphur, *will not coſt much: And laſtly, the Fixation of the* Mercury *will coſt little or nothing, becauſe it may eaſily be abſolved, in a very ſhort time, by One well skilled in the method of fixing. The Burning Spirit may be prepared, and the ſeparation of its* Mercury *from the* Sulphur *be compleated in the ſpace of one day: but yet it is to be underſtood, that this is ſpoken onely to thoſe who deſire but a ſmall quantity to experience the poſſibility of Art. If any one would have a larger quantity of Tincture, he indeed will have need of a longer time to prepare it in, as every one may eaſily conjecture.*

Whilſt I lay diſeaſed in my Bed, and afflicted with a grievous Diſeaſe (after I had by a long and ſerious ſpeculation day and night fundamentally ſearched the power of Art) in the ſpace of one Week, by the hands onely of my little Sons (for I could not truſt ſuch a Work with the unworthy Sons of this World) I made three ſmall trials or proofs onely in a very ſmall quantity, becauſe, by my Bed-ſide, there was no place for doing any great Work. Nevertheleſs, I am ſatisfied that I could do much more in eight or ten Days, and a far greater quantity, if God will be pleaſed to grant me ſtrength for ſo many Days.

Indeed to an ignorant Hearer, what Wiſe men have aſſerted will ſeem incredible to be believed; namely, that in every Herb and Graſs, the true Stone of Philoſophers lyes hid. For the ignorant of Nature wonder at this. But Spagyrick Philoſophers *have, now for many years paſt, publiſhed their Books touching the ſame, and affirmed, that of all things, from which the Elements may be ſeparated, the* Stone *of* Philoſophers *may be extracted and made; of the ſame I alſo, if need were, could alledge many Teſtimonies. May we not by Diſtillation and Rectification much more eaſily ſeparate the Elements from Vegetables, than from rude and hard Metals? And may we not moſt purely and moſt ſubtilly cleanſe their Element of Fire from them? That indeed is impoſſible to be extracted from Metals. But if we can, by the help of Art, turn the moſt pure Fire again into Earth, may not of this new Earth (when it is by the benefit of Art fixed, and rendred conſtant in Fire) be made a Matter purer, than all things in Nature? Every Man knows, that in Spirit of Wine is contained a great virtue comforting the Heart, but by reaſon of the burning heat, which it manifeſts in thoſe that immoderately uſe it, the ſame is avoided not without Reaſon.*

Now,

Now, if you ſhall ſeparate the Burning Sulphur *from the* Mercury, *in the bottom will remain onely a temperate, and to all Conſtitutions (which are vulgarly called Complexions) gratefull pure* Mercury, *in the form of a clear ſweet Water, which* Philoſophers *call their* Water of Life, *and that not imprudently. For the* Alimonies of Life *are included in it, and this* Mercurial Water, *or true* Aqua-vitæ, *may be ſafely adhibited in all Diſeaſes; always, provided that this Spirit be prepared of Wine, Corn, or of Herbs not ſtinking and venomous. But for Metallick Tranſmutation, every diſtilled Wine is conducent, of whatſoever matter it ſhall be prepared. Yet that, in the form of Water, is able to exerciſe no power over Metals, but muſt firſt be reduced into a Red fixed Powder, called by Philoſophers* Gold of Philoſophers, Horizontal Gold, Tinging Gold, *and* Living Gold. *And, in a word, I ſay you cannot find any thing pertinent to Medicine and Chymiſtry, more excellent than our Red fixed* Mercury of Wine: *for it is the true* Phœnix *or* Bird *of* Titan, *feeding its Young with its own Blood; alſo a true* Salamander, *which dyes not, but is nouriſhed and augmented in Fire: and more briefly,* It is all in all things. *Moreover, Philoſophers confeſs that all things lye abſconded in all, and in good* Aqua-vitæ *all Metals are ſpiritually found; which I my ſelf have in very deed experienced, being otherwiſe unable to verifie the ſame. O noble Hermetick Art, and Queen of all Sciences! how baſely and unworthily art thou caſt down, trod under foot by ſtinking Swine, and contemned by ignorant proud Fools! Nevertheleſs, I doubt not but that this little Book of mine will open the Eyes of many blinded with Ignorance, and direct many Readers unto the path of* Verity; *as my Treatiſe lately publiſhed, intituled,* Of the Salt of Philoſophers, *hath already been the Authour of much good to many. For more than one of many, who have ſlighted Chymiſtry, having peruſed that* Enchiridion, *according to my Information, have again fallen in love with Chymiſtry, ſet about the Work (renewing their omitted labour) and prepared the* Salt *of* Philoſophers, *gave good proofs thereof, and having wrought in it for certain Days, at length gloried of their ſucceſſes in Tranſmutation of Metals. Which Stone notwithſtanding is not to be compared with that which is made of Wine or Corn; but in compariſon of that is to be reputed as a Clod of Earth to a moſt beautifull Pearl.*

Wherefore as I before ſaid, and always ſhall ſay, I believe that a Medicine and Tincture more ſublime than the fixed and red Mercury of Wine, hath never been known by Philoſophers. In the mean while, let every other Man believe as he liſteth, it ſufficeth me that I have written the Truth, and refuſed to carry hence with me into the Kingdom of Darkneſs the greateſt Secret of the whole World. But the Reaſons why I here over-haſtily break off the Thread of my diſcourſe begun, and in no-wiſe diſcover the Method by which the Burning Spirit may be prepared, and the Mercury *latent therein be ſeparated from the ſame, and reduced into a fixed Tincture, are weighty and conſiderable. For the whole Work, from the beginning to the end, is ſo very vile and eaſie to be performed, as every Corydon or rude Shepherd (ignorant af all Chymical Arts) would underſtand and imitate that Method of preparing the ſame. Wherefore it is beſt to deſiſt from any further explanation. Becauſe, to whomſoever God will give it, he will ſo eaſily find it out, as there will be no neceſſity of ſpeaking one word more than I have already ſpoke. Beſides, for ſuch inconſiderateneſs, I ſhould be able to give no juſt Account before God, the Judge of the Living and of the Dead, if this moſt ſecret Secret of Secrets ſhould as a Grain of Salt be ſowed among the ungratefull and unworthy People. But the World is too well known to me already: yet I will openly ſay this,* viz. *that the pooreſt Man, as well as him that is wealthy, may attain to this ſupreme Work; becauſe, for preparation of that incomparable Medicine, no chargeable Materials, nor any long time are required.*

Truly, unto me are known divers famous particulars, by the help of which, not onely Silver, but alſo all other Metals are converted into Gold and Silver with great profit, yet are more difficult to be elaborated than that great Univerſal Work. Wherefore this alſo, among all other fruitfull Chymical Secrets deſervedly doth, and undoubted always will obtain the Priority.

Now, Son of Art, candidly accept this my Fatherly Inſtruction, and Friendly Admonition, and do not at all commit any thing to Faithleſs Men, of which thou maiſt have occaſion to repent afterward. Accordingly, to all the Diſciples of Hermetick Philoſophy and Medicine, I wiſh the ample Bleſſing of God, here Temporal, and in the life to come Eternal; heartily praying, that the moſt clear unextinguiſhable Light of God, may perfectly enlighten them, as it did me at the firſt. Amen.

Of the Secret Sal-Armoniack.

TOuching this our Secret *Sal-Armoniack*, I have made mention in divers of my written Books; but the way of Preparing it I have left to be divulged in this place. For after I was assured, that many had laboured much to find out its Preparation and Fruitfull use in Medicine and Chymistry; I resolved no longer to conceal the Preparation and profitable use in Chymistry, of our *Salmiack*, from the Lovers of our Profession; but chiefly for the sake of the Sick (to whom it may be a very great comfort and solace) I chose rather openly to divulge it, without any privy concealment, in these my Writings; hoping that by the publication of this, I shall do good to many thousands of Men, and for a sign of triumphal Joy crown the Head (as with Laurel) of the victorious Queen of the Spagyrick Art.

First of all, it is to be observed, that this Name is imposed upon this Subject, because it in many things agrees with common *Sal-Armoniack*. It pleased us to add the Epithet of *Secret*, because this Salt is known to very few in the whole World; and they who acquired it to themselves, neither published it, nor exposed the same to common use, but kept it to themselves as a great Secret; and as often as they made mention of that Salt in their Writings, they named it their *Salmiack*; for proof of which, if need were, I could produce many Examples.

Cosmopolita, being about to speak of this our *Salmiack*, cryes out thus: *O our Sea! O our Sal-Armoniack!* His *Sea* was Oil of Vitriol, and his *Salmiack* the Volatile Spirit of Urine. When these two are joyned together, they give forth from themselves our Secret *Salmiack*; by the help of which, so many wonderfull Works are performed in Medicine and Chymistry, as you shall here following hear.

Paracelsus and *Helmont* called this Salt, *Alcaheſt*; being that, of which the former writ little, but the latter very many things; and yet both kept the same secret to themselves onely, insomuch as *Helmont* discovered it not, even to his own Son; and other Men, his intimares, requiring it of him, he put off, saying, *It is an Ens very difficult to be acquired:* and thus he freed himself from the importunate Intreaties of many. And how little others could get out of him, is manifest by the following Saying, which is thought to be his. *The Liquor* Alcaheſt *is made of Blood and Urine.* It is credible that he might make such an *Alcaheſt* of those Subjects. But the reason why that kind of *Alcaheſt* may be prepared of Blood and Urine, as well as of Oil of Vitriol and Spirit of Urine, is this: There is a great affinity and similitude between the Macrocosm and Microcosm, *viz.* Man; insomuch as whatsoever may be had in the Macrocosm, may also be found in the lesser World Man. For as in the great World an Universal Acidity, *viz.* Vitriol, commonly is generated in Subterranean Fibres, Beds or Veins, and is there kept in perpetual Digestion by the Central Fire of the Earth, and at length ripened into Mineral and Metallick Bodies; so also, in the Body of every Man, the Blood of the Veins (as an Universal Microcosmick Acidity) is generated, and by long Digestion of the central Fire of the Heart augmented, meliorated, and at length transmuted into Flesh, Skin, and Bones. Therefore, in the Blood of Men or Animals you may find an Acidity, like to that which is found in the great World: Hence it may be said, that our Secret *Salmiack* may as well be prepared of the Blood and Urine of Animals, as of Oil of Vitriol and Spirit of Urine. Nevertheless, I say there is a vast difference between these two; for Oil of Vitriol may be amended and rendred more subtile by Rectification, which Subtiliation cannot be effected with the Vitriolate Acidity of the Blood of Animals. Therefore we deservedly give the Priority to this rectified Oil of Vitriol, as being that, which in every Chymical Labour is found far more efficacious than that of Blood. For this cause leaving that Blood, let us set about the Preparation of our Secret *Salmiack*, with cleansed Oil of Vitriol and Spirit of Urine subtily rectified.

The way of making our Secret Sal-Armoniack.

R*Ecipe* of Oil of Vitriol excellently well defleg-mated and rectified, one pound; upon which Oil of Vitriol, leisurely pour on so much highly rectified Spirit of Urine, as untill there is no more action each upon other, but they be mortified and still. In that Conjunction, from two Contraries, ariseth a middle Salt. This Operation being rightly performed, you will find a sharp penetrating Liquor, in which is a power of carrying upwards with it self the purest Essences from Animals, Vegetables, and Metals: which is what no other Entity in Nature is able to perform, as we purpose to shew. Therefore if any one, desirous to make of this Salt Liquor a dry *Salmiack*, do in gentle heat of *Balneo* abstract the unsavoury Water thence, in the bottom will remain a fair white Salt, which is our Secret *Sal-Armoniack*; by the benefit of which wonderous Works, may be performed in Medicine and Chymistry, as hereafter you shall hear. Now follows

The Use of our Salmiack, *by the help of which, from* Vegetables *may be extracted very efficacious, and indeed incomparable Essences.*

HOW or which way the Ancient and Modern *Spagyrists* prepared their Essences of Vegetables, is now long since well known throughout the World, *viz.* by Spirit of Wine. Which way of Extracting is indeed of it self a Work very chargeable; yet Spirit of Wine readily extracts the Essences of Vegetables and Animals, leaving the unprofitable Fæces behind. Also, it is not unknown to us, that Spirit of Wine in extraction so notably changeth the Virtues of things extracted by it, as the Extract is of less force than the Simple whence it was made, and that most manifestly in *Cathartick*s or Purging Simples, insomuch as commonly the Dose of the *Extract* must be greater than of the *Simple* it self. The reason is, because all Purgers acquire the greatest part of their Cathartick faculty from that crude and immature Substance, with which they oppose the Stomach, and therefore are not entertained by it, but presently expelled, during which Expulsion the Excrements also are cast out. Therefore the stronger Crudity is predominant in Purging things, the more impetuously do they move the Stomach; and the more strongly the Stomach casts out and expells that, so much the more vehemently also are the noxious Humours of the Body cast up. If a Cathartick be too crude, rough and

and immature, the Stomach rejects it much more ſtrongly, becauſe the whole of Nature is thereby diſturbed, and with all its might endeavours wholly to expell ſuch a rude gueſt. In which violent expulſion, the Radical Humours are expelled out of the Body, together with the Excrements, that the Body may be totally freed and disburthened of the pernicious filth of them.

The Stomach ſo abhors ſome Vegetables, and is ſo impatient of giving them any time to abide there, that they may by little and little be expelled downward by Seidge, as it (enraged with ſo great nauſeating and loathing) violently caſts them up. In which Excretion a tenacious viſcous Choler, always hurtfull to the Stomach, is expelled, which would difficultly otherwiſe be caſt out by gentle Purgations, as is ſeen in *Aſarabacca* and *Hellebore*. For as often as they are taken by a ſick Man, without any previous Preparation, they continually excite Vomiting; but if extracted with Spirit of Wine, they vomit not, but onely work downward.

By all which it appears, that Spirit of Wine, in extracting the Eſſences of Vegetables (by its natural power) ſo notably changeth the Virtues of Herbs, as it is not fit to be uſed for all kinds of Extractions; and that by reaſon of its Nature varying or altering the property of things. Nor can you, in ſome Diſeaſes, ſafely uſe thoſe Extracts which are made by Spirit of Wine, becauſe Extracts are heightned in their Heat by the Spirit of Wine, and therefore ſhould be avoided in acute or burning Diſeaſes. On the contrary, our *Menſtruum*, viz. our Secret *Sal-Armoniack*, in Extraction, alters not the Virtues of Species for which it is uſed, but extracts from them onely what is moſt pure, and carries over with it by Alembeck, a certain moſt ſweet Eſſence, which Spirit of Wine can in no-wiſe perform. Therefore we deſervedly give Priority to our Liquor *Alcaheſt* in extracting the Eſſences of Vegetables and Animals. Yet we would by no means labour to bring Spirit of Wine into contempt, ſince it, in ſome ſubjects, ſo excellently exerciſeth its power, as it gives place to no other thing. But the Water of our Secret *Sal-Armoniack* perfects its Extraction in a far differing manner; becauſe, by the help of Art, that conjunct of two ſharp penetrating Entities (viz. *Acid Oil of Vitriol*, and *Alcaliſate Spirit of Urine*) is reduced into one temperate middle Salt, which Salt is almoſt of the ſame diſpoſition as common *Salmiack*, except that in all its Operations it is found to be more ſharp, more penetrating and more efficacious than it.

Now let us come to the matter it ſelf, that we may ſee of how great uſe our *Alcaliſate Vitriol*, or *Vitriolate Alcali*, is for preparing ſome famous Medicine. I ſuppoſe it will be worth my while, if I firſt of all begin with that Medicine which *Paracelſus* taught to be made of *Aloes*, *Myrrh*, and *Saffron*, and is by venerable Antiquity, and by all Authours of long life highly commended, and named *Elixir Proprietatis*. And ſince *Paracelſus* in deſcribing ſo noble a Medicine, uſed few words, but enlarged them much in extolling his *Elixir Proprietatis*, it will not be amiſs for us, in this place, to tranſcribe his own Words following, thus:

" So alſo Nature ſheweth us an *Elixir*, is that " which of Natural things may be made compleatly " perfect in its proper Eſſence. Such is the *Elixir* of " *Myrrh*, *Saffron*, and yellow *Epatick-Aloes*. But " whence they have this power, we have ſhewed " in the generation of them. But we come now to the Proceſs, (omitting their beginning, of which we ſpake before) which runs thus.

" *Recipe* of Myrrh, Epatick Alloes, and Saffron, " of each one Part, which digeſt together in a Pelli- " can placed in Sand, for two Months with gentle " heat. Then by Alembeck ſeparate the Oil from " the Fæces without Aduſtion. This Oil digeſt to- " gether with an equal Weight of the Circulate for " one Month, afterward keep it.

" In this are all the natural Vertues of a Balſam, " and a greater conſervative Vertue for thoſe that " are aged, than is lawfull for a man to utter: " becauſe from it proceeds not one Age onely, but " 4, 7 or 10, *&c.* It is ſcarcely poſſible to expreſs the " Vertues and Natures of it: But as we iudge, " enough is diſcovered by us already, which we think " needs no further Interpretation.

Here *Paracelſus* deſcribes his *Elixir* in words ſo obſcure, and likely to cauſe Errour, as no man untill this day could ever prepare any thing that was excellent, according to the tenour of his Words: *Helmont* among others complaining, that he concealed the uſe of the Alcaheſt in deſcribing the manner of that Preparation. For whoſoever uſeth that, in ſuch a Preparation, he obtains a Medicine of ſo great vertue, as it is able to do whatſoever *Paracelſus* aſcribes to his *Elixir Proprietatis*.

But if any man be not ſatisfied in what is here publiſhed by me, let him conſult *Helmont* diſcourſing thereof more at large.

Now behold here preſented to thee my Proceſs for preparing a Medicine of theſe three *Species* reduced to Powder, *viz.* of Myrrh, Alloes and Saffron. I took of that mixture 8 Lotones, 4 Ounces, which I put into a Phial, and upon the ſame poured one Pound and half of our good Alcaheſtick Liquor, theſe I ſet into a warm Bath to be digeſted for two or three Days. During this digeſtion our ſharp Liquor diſſolved theſe *Species*, and very well united it ſelf to them. This being done, I poured the whole mixture out of the Phial into a low Cucurbit of Glaſs, and well luted the Head to the Receiver, and by gentle heat of *Balneo* cauſed whatſoever would aſcend, to be gathered apart in ſeveral Recipients

1. A white penetrating Aromatick Spirit, of a moſt fragrant Odour according to *Helmont*'s words.

2. A yellow and red Spirit, and both indeed very efficacious. Yet each of theſe ſhould be received apart.

3. Laſtly toward the end (after all the moiſture is aſcended, and the Fire is a little ſomewhat encreaſed) a ſtrong ſcented red cleaginous alkaliſate Liquor; which is ſuch as ſerves inſtead of a Balſam, moſt excellent, preſently helping or very ſalutary in all green Wounds and fiſtulous Ulcers. The ſubtile Spirit ſhould be adminiſtred inwardly, for comforting or ſuppling the Body with all its internal Members, and for preſerving the ſame magiſtrally from all vitious affects. Such a moſt preſent Remedy is earneſtly deſired, by the aged and weak. The Ingredients are of a Balſamick Diſpoſition, and the preparation of them is artificial and ſubtil, ſo as a famous Medicine cannot chooſe but be made of them. For our *Salmiack* is of ſuch a Nature, as by it all Vertues of Vegetables, Animals and Minerals are exalted, amplified and meliorated, and that by reaſon of the Exaltation by it inferred on the Subjects in elaborating; as may more exactly be learned, when any one goes about to prepare the ſame, and ſhall

as

as it were with his hand, palpably touch the vertue, and diſcern the verity thereof. Therefore here is inſtituted a Proceſs of preparing Saffron, Aloes and Myrrh, by which you may know how to work with other Vegetable and Animal Subjects, ſo as we have no neceſſity of preſcribing a peculiar Proceſs for every Medicine. Here onely it is to be noted, that an accurate Regard is to be had of weight and meaſure in mixing the Subjects with the Liquor Alcaheſt. For if leſs of the Armoniack Liquor than is fit be added to a dry matter, all the Liquor ſo includes it ſelf in the dry matter, as little of the Spirit can aſcend in diſtilling. But if more of the Liquor be poured on than is fit, the aſcending Spirit will not be efficacious enough, becauſe the vertue of that Subject diffuſeth it ſelf too largely into that aboundance of Spirit. Wherefore in all things meaſure and weight are to be obſerved. Dry *Species*, ſuch are Herbs, Roots, Seeds and Flowers, drink up much Water; but Woods not ſo much, Stones and their like, much leſs than they. Therefore, if any one, in labours of this kind would do ſomething to purpoſe, he had need to be wary, that he do neither too much, nor too little, but in all things obſerve a mean: ſo doing, he ſhall ſuffer no loſs, nor ever labour in vain. For it is almoſt impoſſible to deſcribe all *Arcanums* ſo evidently, as every Clown may comprehend the ſame without any ſearch.

I have here laid Foundations with reaſon ſufficient, every one may build, or not build upon them as he pleaſeth. Alſo he may read *Helmont*, who did indeed of this matter write largely enough, yet he is not always to be underſtood according to the Letter; for in moſt places of his Books, he concealed his manual Operations, eſpecially in his Book of the Tree of Life, where he treats of the Cedar Wood. The preparation of the ſame requires no tedious long ſpace of time, but it may be performed in a few hours. Indeed it would be the part of good Phyſicians to introduce this Preparation of more noble Medicines into their Apothecaries ſhops, and thence to exclude ſome part of their corrupted Remedies. For this being done, ſo many men would not be baſely neglected, nor untimely hurried out of this Life, by the uſe of unprofitable Medicaments, as too too often now are.

It is not enough for you to have a Name from *Galen*, and in the mean while not at all tread the Footſteps of *Galen*'s vertues. *Galen* was an honeſt Heathen, and whatſoever he had gathered with much and long ſtudy, he left to us accurately written before his Death.

How experienced a man in Medicine *Hippocrates* was, his Writings do clearly ſhew.

Alſo that *Avicen* was an induſtrious Phyſician, by his remaining Litterary Monuments, is very manifeſt, and eſpecially by that Epiſtle, which he writ to his Son *Aboali*; for in that he commands him firſt to furniſh himſelf with ſixty Pound of moſt pure Mercurial Water (whence he ſhould make the univerſal Medicine) before he preſumed to proceed to Coagulation of the Stone.

Theſe indeed were men adorned with high Experience and a good Conſcience, who gloried not in the bare Name of Chief Phyſicians, but proved themſelves ſuch indeed, ſhewing, that they were not idle Adorers of the Goddeſs *Vacua*, but men moſt laborious, as becomes every conſcientious Phyſician to be.

Touching that Mercurial Water, which *Avicen* commended ſo much to his Son, for making (of it) the Univerſal Medicine, we ſhall here following (*Jehovah* aſſiſting) ſomewhat more largely ſpeak, *viz.* how it, by our *Salmiack* may be extracted from Metals, and then be coagulated into an Univerſal Medicine.

Indeed, particular Medicaments are not to be contemned but to be eſteemed as good things, to them that make a good uſe of them. But Univerſals are ſought by Phyſicians, being ſuch, as by which they can get more Honour and Riches, than by Particulars, becauſe they are known even to every old Woman. Univerſals are not to be uſed after the manner of Particulars, particularly to ſerve for this or that Member of the Body, or to reſiſt and heal this or that Diſeaſe onely: but they ſeek out every *Chachexy* (which lies privily diſperſed through all parts of the Body, impairing Health) and having ſought it out, caſt it forth of the Body, as well viſibly as inviſibly through all Emunctories, as ſhall ſeem good to Nature, and will be moſt conducent to health. Univerſals conſume occult Diſeaſes hidden in the Body of man, as Fire conſumes Wood. Alſo Univerſals tinge every vitious Habit of the Body (which otherwiſe can be expelled by no particular Medicine) and tranſmute it into a better State, ſo as the Evil of the Diſtemper is inverted and converted into good, in the place where it is hoſpited, no further expulſion being required. Of like Univerſals, we will afterwards (God giving leave) ſpeak more at large. Now the time admoniſheth us to return to our *Sal Armoniack*, to contemplate what farther fruit of Utility it is able to effect in Medicine.

Helmont, in his Treatiſe of the Stone makes mention of a certain Medicine, which by his Alcaheſt he prepared of *Paracelſus* his *Ludus*, which would reſolve the Stone in the Bladder, and expel it in fourteen Days. *Paracelſus* aſcribes to his *Ludus* wonderfull Vertues, which it exerciſeth in breaking and expelling the Stone of the Reins and Bladder. In which *Helmont* poſits his Foundation, ſhewing where ſuch a *Ludus* may be found, and how by his Alcaheſt it may be prepared into a Medicine ſo admirable, as it becomes the ſupream Remedy againſt the Stone.

As touching the *Ludus* it ſelf, *Helmont* ſaith of it, that it may be copiouſly found in the Scald ſhores at *Antwerp*, and that it for the moſt part conſiſts of a certain volatile Macrocoſmick Urinous Salt: and I making ſearch into the ſame, have found it juſt as he deſcribed. Likewiſe, I alſo, according to his preſcribed Rule, endeavoured to make ſuch an excellent Medicine, and then found the Liquor of the *Ludus* to be ſuch as he affirms he himſelf made by his Acaheſt, *viz.* this way.

I took one Pound of that *Ludus* beaten to Powder, and mixed it with one Pound of our Secret *Salmiack*, and thence drew off the volatile Humidity with gentle Fire in a coated Retort; and then augmenting the Fire until the Retort was very hot all over. When all was cold, I found the *Ludus* with the more fixed part of our *Salmiack* melted together into a yellowiſh dark coloured Stone, which (according to his Doctrine) I laid in a moiſt Cellar to be diſſolved, and that Stone in 24 hours was reſolved into a greeniſh Liquor, and it had a burning Taſte upon the Tongue, yet it is not loathſome to be taken into the Body, with Wine, Beer, or other ſuitable Vehicles of Water. I my ſelf alſo have given this Liquor to ſome troubled with the Stone, who by taking it were

were greatly eaſed. But that the whole Stone ſhould by help of that be reſolved and caſt out, in ſo ſhort a ſpace of time, I have not yet found. Hence here it ſeems to me, that *Helmont* (as did *Paracelſus* in the Preparation of his *Elixir Proprietatis*, and the incredible Vertue thereof) hath extolled his Remedies with a too much elated Style. They are aſſuredly admirable Medicaments, but that they are able to effect ſo much (in all men without diſtinction) as are aſcribed to them, I cannot aſſentingly witneſs, although I was at great expences, and not a little turmoiled about them, yet in the mean while I found out many excellent things, the Declaration of all which would be too tedious to be here inſerted. But I muſt needs, in this place, inſert ſome few of thoſe many things I then found out.

If any one apply to the Seeds or Roots of thoſe Herbs, which are commonly wont to be adminiſtred, for expelling Urine and the Stone, (the Seeds or Roots being firſt reduced to Powder) a little of our *Salmiacal* Water, and digeſt it in gentle heat of *Balneo* for 24 hours, and afterward diſtil it, a moſt efficacious Spirit will aſcend; which Spirit I have found to be more excellent in expelling the Stone, than the *Ludus*. In like manner thoſe inſects, which ſtrongly provoke Urine and the Stone, I have alſo digeſted and diſtilled with our Liquor of *Sal Armoniack*, and got a Spirit more ſtrongly expelling Urine, than any Spirit prepared of Herbs. Wherefore this is to be warily uſed, and ſuch forcibly expelling things well obſerved, among which more forcible than all other are the fat evilly ſmelling black Worms of *May*, and Cantharides.

After the ſame manner, as we have taught to be here done, may alſo be inſtituted an Operation for extracting (by diſtillation) from all Vegetable and Animal Subjects their moſt potent Vertues and pureſt Eſſences, by our Vitriolate Alcalick Water; *viz.* from Aromaticks, egregious Cordials; from Woods and Roots of Sudorifick Herbs, famous Diaphoreticks; from ſoporiferous Simples, admirable Anodines; from purging things moſt excellent Catharticks, *&c.* But there is no reaſon I ſhould longer inſiſt on theſe things of leſs value, ſince every skilfull man can prepare himſelf ſuch medicinal Spirits as he hath need of. Here he cannot eaſily commit error, ſince for all Herbs, Seeds, Roots, Flowers, and Woods, there is but one onely way of preparing them into moſt efficacious Eſſences, by our vitriolate Alcaly. But a better way than any other, yet to be diſcovered, how by our Urinous Liquor, yet more efficacious Eſſences may be extracted from Vegetables and Animals, is this:

We are not ignorant, that Spirit of Wine, which is for the moſt part generally uſed for Extraction of Vegetables, doth not ſufficiently extract them, nor carry upwards with it ſelf what is extracted; but *per ſe* onely aſcends, and leaves the Extract in the Bottom of the Veſſel. On the contrary, our vitriolate Spirit of Urine (much more ſharp than Spirit of Wine) doth not onely powerfully invade Vegetables, and attract to it ſelf their Eſſences, but alſo in diſtillation carries them up with it ſelf, which is impoſſible for Spirit of Wine to do. For although the Spirit of Urine (according to the external Face) doth as it were mortifie the corroſive Oil of Vitriol, and change it into a volatile Salt, and the Oil of Vitriol coagulates the ſubtile Spirit of Urine into a volatile Salt, inſomuch as of two unlike Entities is made a middle Salt; yet both thoſe unlike parts are not wholly changed in their former Nature. For the Acidity of Vitriol remains yet acid, and the Urinouſneſs of the Urine urinous; and both alſo by the help of Art may again be ſeparated each from other, ſo as either of them may perfectly recover its own priſtine qualities, and nothing of them be found to be loſt. As for example, ſuppoſe

It be required, that I ſhould recover my Spirit of Urine, as pure and ſubtile as it was when poured on the Oil of Vitriol: Then I add to our *Salmiack* (according to juſt meaſure and weight) onely ſo much *Lixivium* as of the Acidity is mortified, and the Spirit of Urine aſcends ſubtilly pure again, and full as good as it was before its conjunction with the Oil of Vitriol. But the Oil of Vitriol is altered, and by the Salt of Tartar reduced into a middle Salt, which alſo wants not its Fruit of Utility in Medicine and Chymiſtry. If you would from this mixture recover our Acidity with the Spirit of Urine, add to our *Salmiack* a Subject eaſily diſſolvable; mix and give a gentle Fire, for then the Acidity ſets upon that Subject eaſie to be diſſolved, and diſſolves the ſame, and makes abundance of its concomitant Spirit of Urine to aſcend, which in its aſcent takes up with it ſelf the pureſt Eſſence of the Subject added, looſed by the Acidity in Solution, and thenceforth may be uſed for Medicine and Chymiſtry, according as the Subject was. For Example, If I add red Corals beaten to Powder to my Alcaheſtick Liquor, the Acidity corrodes thoſe Corals without any delay, and lets go the Spirit of Urine, which brings over the helm with it ſelf the Eſſence of Corals. But the Acidity, when you pleaſe may by diſtillation be ſeparated from the Corals. If to our Liquor be added Pearls, the Spirit carries the vertue of them upward with it ſelf. And if you add Stones, Minerals and Metals, the Spirit of Urine doth likewiſe carry up with it ſelf the Eſſences of them. But the Acidity remains in the bottom with the Stone or Metal, and may afterward diverſly be again ſeparated from the Stone or Metal, and applied to this or another uſe.

Having already heard how the moſt pure Eſſences of Vegetables and Animals, by our ſecret *Sal Armoniack* are to be diſtilled by aſcent, let us now alſo ſee, how Metals and Minerals may be highly purged by the ſame, and reduced to their firſt matter: which firſt matter is no other than a moſt ſubtil Mercurial Water, in which the pureſt part of the Metal is latent in the form of running *Mercury*, which *Mercury* is fit for preparing whatſoever Work you will of it, either *Sol* or *Luna* particularly, or a true Univerſal Tincture, vaſtly tinging. Nature, in the Bowels of the Earth did primordially generate all Metals of ſuch a volatile *Mercury*. For when the *Aſtrums*, through the Air, ſeminate their metallick Seed, that Seed is from the Air introduced into the Earth, where that, as matter clean or unclean offers it ſelf, produceth Metals either pure or impure. Wherefore Philoſophers rightly determine the Root of Metals to be fited in the Air, but their ſtem and branches in the Earth. Daily experience teacheth us to give credit to this, as often as in digging we come to the deepeſt ſcituation of Metals, great Experiments of this matter diſcover themſelves to us, but becauſe touching this enough hath been ſaid already, we forbear to proceed further in ſuch a Diſcourſe. Here enough is ſaid, namely, that we know the Original and beginning of all Metals to be no other, than an Airy ſubtile Spirit, in which are reconded the Sul-

phur and *Mercury* of Metals. Therefore, ſince here my purpoſe is to give ſo great Information to every moſt unskilfull man, and as it were to put that in his hands, which may be done by the help of our ſecret *Salmiack*, I think not amiſs openly to diſcover certain Examples of Proceſſes, evincing the power of the ſame. Wherefore I here offer a Poſſible

Way of preparing a ſubtile Mercurial Water (from which a running Mercury, called by Aucient Philoſophers, the Mercury of Philoſophers, may by the help of Art be ripened into a moſt potent Tincture) out of all Metals by the benefit of our ſecret Sal Armoniack.

LET the Searcher of Art know, that the Preparation of the *Mercury* of Metals and Minerals, is of a diverſe kind.

But generally, a Mercurial Water may be prepared of all Metals, yet of one more eaſily, than of another.

Recipe the filings or raſpings of a Metal, as *Mars*, *Jupiter* or *Venus*, one Pound, with which mix half a pound of our dry *Salmiack*. If theſe be well mixed and by Retort diſtilled, the metal will be corroded by the Acidity, and the *Mercury* thereof be freed from its bonds, or ſeparated by Diſtillation, becauſe the Spirit of Urine carries that up with it ſelf inviſibly; but when the Spirit is extracted from it, it becomes viſible, as afterward ſhall be taught.

If you pulveriſe the Remanency or Reſidue of the Metal, and boil it with Water, you will have the Vitriol of that Metal you uſed, *viz.* of *Mars* green, of *Venus* blew, of *Jupiter*, *Saturn* and *Luna*, white, of *Sol* yellow. The cauſe of ſuch Vitriol is this: ſince the Acidity of our *Salmiack* adheres to the Metal, it in ſome ſort diſſolves that, and in ſuch wiſe prepares it, as by the help of common Water, the ſame may eaſily be diſſolved.

Note: If the Metal (which ſhall remain in the bottom of the Veſſel, after the Vitriol is extracted from the ſame by the help of Water) be mixed with freſh *Salmiack*, that will again be conducible, but not yield you ſo much *Mercury* as you got the firſt time. And if you make the ſame trial a third time, a little *Mercury* will aſcend, but not ſo much as did the ſecond time.

Which cropping of golden Branches from the ſhaded Tree *Virgil* excellently diſcovered when he ſaid: One being pulled off, another ſucceeds, if the Fates call thee, otherwiſe by no ſtrength, nor any Iron, canſt thou pull off that Branch. Of which cropped or pulled off Branches, the firſt is greateſt, and moſt rich with Gold; the ſecond is leſs and more poor; the third much leſs and moſt poor. Therefore it will be no profit to you to pluck off more than one Branch, but it is better in proceeding further, always to take new matter.

Out of that Vitriol in another certain manner, *Mercury* may again be extracted, which *Mercury* will be far more noble than the firſt, as ſhall be ſhewed more at large here following.

In the mean while, to the Lovers of this moſt noble Art, I cannot chooſe but demonſtrate a wonderfull thing, which is this: Whenſoever you ſhall pour Spirit of *Jupiter* (prepared in the above commemorated manner, and moſt ſubtily rectified) upon the Spirit of *Mars*, the *Mercurys* both of the *Mars* and *Jupiter* will ſuddenly embrace each other, and be connexed in ſuch a bond of Love, as leaving the Water, they will conjunctively ſettle to the bottom in the form of very ſmall golden Atoms; which Atoms of Gold, in that moment in which they are formed of both the *Mercurys*, you ſhall ſee converted into conſtant and fixed Gold. Which I take to be one of the greateſt Wonders, which ever came to my hand in all my Chymical Labours. If I had tried this Experiment but once, I might my ſelf have doubted the truth of the ſame. Indeed I have found out the cauſe of this ſwift fixation of *Mercury*; but I ſhould do very inconſiderately to divulge the ſame. *Paracelſus* writes in his Heaven of Philoſophers, that no melioration of Metals is to be expected, unleſs they be firſt ſpiritually mixed. Other Philoſophers likewiſe ſay, Metals are firſt to be reduced to their firſt matter, that is, into a ſubtile Spirit, before they can be nobilitated and bettered: which I know to be conſentaneous to verity, according to the Teſtimony of the following Example; which is another wonderfull Experiment, to be performed (by the Spirit of *Jupiter*) thus.

Diſſolve a little Gold in common *Aqua Regia*, into which Solution pour a little of our mercurial Water, mix it by ſtirring or ſhaking the Veſſel well: then the *Mercury* of *Jupiter* in a magnetick way, continually attracts the Gold to it ſelf from the *Aqua Regis*, and tingeth the Water with a Blood Red Colour, at length the Gold, with the *Mercury* of *Jupiter* conjunctively will be precipitated to the bottom of the Veſſel, in the form of a purple Powder: which being edulcorated and reduced with *Borax*, the greateſt part of the *Mercury* vaniſheth, but a little of it will remain with the fixed Gold, and render that ſnow like and friable. By which we may ſee in how great Love Gold anſwers to Tin.

Yet this is not the true way of preparing any thing eminent, and to purpoſe of both. Therefore, if any one expects a noble product from both, he muſt with gentle Fire fix this purple Gold, that the *Mercury* of *Jupiter* may not fume away, but remain with the Gold.

In both theſe recited Experiments to our ſight is expoſed ſo ſwift a Fixation of *Mercury*, as every man, although but of weak Apprehenſion, may eaſily ſee, that the Tranſmutation of Metals is truly true, and that the ſame (by the help of the fixed *Mercury* of Metals) may be done by projection in a moment. For *Mercury* fixeth *Mercury*, being joyned in a juſt proportion. Therefore if volatile *Mercury* can do that, how much more will the ſame, when fixed perform, being that, which bears about it ſelf its own Sulphur.

Athough I could as well diſcover other ways of preparing a good Mercurial Water of a Metal, by our ſecret *Sal Armoniack*, yet I conſider, ſuch a Liberty of publickly imparting things, would rather be injurious, than profitable; becauſe Pearls would be without diſtinction, caſt before every ſordid Swine. But more than enough being already publiſhed, Time admoniſheth us to deſiſt, eſpecially becauſe there is an intire Treatiſe of the *Mercurys* of Metals written and publiſhed. Yet I muſt confeſs, that this *Mercury*, prepared by the help of our *Salmiack*, is of another nature and property than the other prepared in another manner. There is little elſe now remaining, unleſs, to ſhew the way of extracting *Mercury* from Minerals, by help of our ſecret *Sal Armoniack*; which *Mercury* is able to effect as much in Medicine and Alchymy, as the other extracted out of Metals. Here follows

The

The Proceſs.

Recipe of Antimony pulveriſed one Pound, of our *Salmiack*, ½ a Pound, theſe well mixed, diſtil by Retort, and our *Salmiack* will all come off, and by the Alembick carries with it ſelf the moſt pure *Mercury* and Sulphur of the Antimony, of a Black Aſh Colour, which Sublimate is named the Head of the Crow. For if you caſt a little of it into pure Water, the *Salmiack* will melt, and the *Mercury* and Sulphur will remain in the Veſſel like a gray Powder, which if you dry, and then touch it, you will find it like to thin light Feathers, whence it acquires to it ſelf the Name of the Crows Head. Therefore, when you ſhall make it hot in a Crucible, it melts into a red Stone, which indeed is nothing conducent to our purpoſe. Yet if you would thence make ſomewhat that is excellent, you muſt obſerve ſuch a Proceſs as this, here following. Put your gray ſublimate or Crows Head, which did aſcend (being firſt reduced to Powder) into a Glaſs Body, and upon it pour ſo much of my Tartar, as ſhall be needfull for mortifying the Oil of Vitriol, then lute an Head thereon, fitting a Receiver thereto, and ſubminiſter Fire in Sand, untill all the Humidity ſhall aſcend. This being done the Acidity remains with the Salt of Tartar, and the Spirit of Urine aſcends alone, carrying upwards with it ſelf the moſt pure inviſible *Mercury* of Antimony, which afterward by the help of *Sol* or *Luna* (as above we taught of *Mercury*) becomes fixed and viſible. But a very ſmall quantity of *Mercury* aſcends, which doth much diſpleaſe the unſatiable Slaves of *Avarice*; becauſe they rather take delight in immenſe Maſſes of Gold, equal in magnitude to the Head of an Ox. Yet no good man deſires that, but is content with that little, which God is pleaſed to give him. Nevertheleſs, if any one would have a great quantity of that, he may obtain the ſame. For the Subjects, whence it is extracted are preparable for no great charge, being ſuch, as enough of them may always be had. From one Pound of this mercurial Water, ſcarcely three or four Grains of corporal *Mercury* will aſcend. For the greateſt part of it remains in the bottom with the Sulphur and Salt, which are fixed apart, as hereafter ſhall be taught. But in that ſo little *Mercury* lies hid in the mercurial Water, other Philoſophers alſo knew, unanimouſly teaching, that *Avicen* is to be followed, admoniſhing (in a certain Epiſtle to his Son *Aboali*) all that he had need of 60 Pound of moſt pure mercurial Water. For if the whole Water were *Mercury*, there would not need have been ſo much. Philoſophers call this not *Aqua Vitæ*, but *Aqua Vitæ*; becauſe the *Mercury* in it is moſt ſpaciouſly diſſipated, as afterward (God willing) ſhall be diſcourſed more at large.

Now returning to our *Crows-head*, let us ſee whether it may be made white, by a lotion of a ſharp *Lixivium*. If you take the Glaſs out of the Sand, after you have once abſtracted thence the Mercurial Water, you will find your black Crow turned into a white Swan: for in the Glaſs you will find a Snow-like Salt, which if you take out, and put into another round Glaſs, or Philoſophick Egg, and ſet that into a Fixatory Furnace to be fixed, the white Colour in twenty fours hours waxeth yellow, and a little after puts on a Blood-like Colour. Yet it is not then ſo well fixed, as that it may be taken out, but muſt be ſuffered to ſtand for ſome time in burning Coals; yet with this Caution always, that the Fire be no ſtronger, than by which the Red Stone may be liquified, and remain liquid in, like Oil. For it will melt as eaſily as Wax, and neither the *Mercury*, nor the *Sulphur*, nor the *Salt* evaporate; which is that which affects the mind with admiration. I have made trial of this in a Glaſs with a long neck ſtanding out of the heat, where I could ſee not ſo much as one Grain to aſcend; whence I conclude the ſame Operation may be done, and ſuch Fixation made in an open Fire in a covered Crucible made of good and fit Earth well burnt. For the Salt of Tartar united with the Acidity of Vitriol, doth ſo embrace the whole *Mercury* and *Sulphur*, and as it were hold it concluded in it ſelf, that the ſame is compelled to abide in the Fire, and permit it ſelf to be ripened. Thus this volatile Salt to our *Mercury* is the *Luting* of *Sapience*, and *Seal* of *Hermes*, with which it is ſo bound, as it is conſtrained to abide in Fire untill 'tis fixed. After it ſhall be fixed, it may be uſed with admirable profit in Medicine and Chymiſtry. But you muſt rightly make trial, whether it be well fixed or no, thus: Put an Iron Wyar into the liquified Maſs, and with that take up a ſmall quantity for proof. Waſh away the Salt from it, and caſt the Red Powder upon a Silver Plate heat red hot: if it fume not, but enters and tingeth the Silver, not with a black, but with a yellow Colour, then the *Mercury*, with its *Sulphur*, is fixed. Whoſoever hath but once fixed this Stone, hath done a very great and profitable Work, although he hath ſpent many Weeks in preparing the ſame. For ſo ſoon as the *Mercurial Sulphur* of *Antimony* ſhall be fixed, ſome of it may preſently be applied to neceſſary uſe, and inſtead of that as much volatile and immature *Mercury* added; then the fixed *Mercury* willingly admits into it ſelf its Brother not fixed, that together with it ſelf it may alſo become fixed. Therefore as many Months as the firſt Fixation required for its perfection, in ſo many Weeks may the ſecond be abſolved. Alſo the ſecond Fixation being compleated, another part of the Medicine may again be taken out, and other not fixed *Mercury* again be put in, and ſo forwards to infinity, or as long as the Artiſt ſhall think fit.

Although this fixed Tincture of *Antimony* be an Univerſal Medicine, healing all curable Diſeaſes; yet for Metals it is onely a particular Tincture, by help of which you may indeed convert Silver, by graduating, and at times, into Gold; but yet at one time you cannot tinge the whole Body. For God hath not endowed it with ſo great power, yet he hath liberally beſtowed that on it which is worth while; inſomuch as we owe as great praiſes to God moſt high for the ſame, as they are obliged to render to him, who are partakers of the great Stone of Philoſophers.

As we have hitherto taught the way of Preparing a particular Tincture for Metals, and an Univerſal Medicine for humane Bodies of deſpicable Antimony; ſo alſo may a Tincture be made of *Auripigment*, immature *Mineral Electrum*, *Cinnabarine Sulphur*, and all other ſuch like, by the help of our Secret *Sal-Armoniack*. Wherefore, by this one onely Proceſs is ſufficiently explained, how from other like Subjects (where *Sulphur* and *Mercury* are conjoyned) ſuch a Medicine may alſo be prepared.

Whoſo-

Whoſoever well underſtands this way of fixing *Mercuries* preſcribed by me, will find more Secrets than he can ever think of, imagine or feign to himſelf. For ſince ſuch a Fixation may be performed in open Earthen Veſſels, you have not onely this conveniency, that as often as you pleaſe you may take out ſome of it, and make trial untill you come to a perfect Fixation; but alſo you have this prerogative, that your *Mercury*, with its *Sulphur*, is fixed with a flaming Fire, which always immediately toucheth our *Sulphur* and *Mercury*, and exalts the ſame in its own congenited Tincture, which is what a cloſe Fire cannot do. Every Fire, by its own nature and property, infers a Tincture in Mineral Subjects, eſpecially when the Flame can immediately touch the Subject neither cloſed nor open, as above you heard, where we treat of Rubefying the fixed white *Sulphur*. We diſcern the ſame in Crucibles made of white Earth, and ſet one within another, that the outmoſt, which is expoſed to the touch of the Flame becomes Red; but thoſe which ſtood within it (being free from the contact of the ſame) remain white.

Alſo we are not ignorant, that thoſe who make Tobacco-Pipes, (that they may have them purely white) do burn them in a large Pot, that they may not be touched by the Flame, and ſo be tinged with Redneſs. Whence it is ſufficiently underſtood, that even in Fire is a Tincture, by which white Bodies are tinged with Redneſs. Hence I, not without reaſon, ſay: He is not ill adviſed who ripens his Tinctures under a certain Covering in open Veſſels, becauſe they that way are not onely ſooner fixed, but alſo exalted in their Colour; yet with this Rule always obſerved, *viz.* That the Tinctures be always ſealed with *Hermes Seal*, or Philoſophically ſurrounded or luted with the *Luting* of *Sapience*. Where note, that the *Luting* of *Sapience*, of which I here treat, is not to be uſed for fixing all Subjects, and preſerving them from flight; but it is an emolument and help to thoſe Subjects onely, which are as well Sulphureous as Mercurial, and delight in the Communion of conſtringing themſelves by theſe Salts, and without departure conſtantly remain with them in Fire, and preſerve them alſo from flying away. That by ſuch a way, *viz.* by the benefit of *Hermes Seal*, Mineral Sulphurs may be fixed into Tinctures, ancient Philoſophers cloſely concealed as a principal *Arcanum*, and ſcarcely any of them hath ever made mention of an Artificial Fire, except that very ancient Philoſopher *Artephius*, who moſt excellently ſpeaks much after this manner: *Our Fire diſſolves all things, penetrates all things, deſtroys all things, participates of Sulphur, is equal, continual; yields no ſmoak, unleſs it be excited, for Matter it is taken from elſewhere*, &c Now accurately mind, whether here is not notified ſuch a Fire [as I ſpeak of] *Pontanus* in his Epiſtle ſaith, he travelled almoſt all the World over, that he might find ſome true Philoſopher, of whom by Converſe he might be taught ſomewhat of the *Secret of Secrets*: and that he met with ſome Philoſophers, but they were onely erroneous Vagabonds and great Impoſtors; alſo that at length (after he had erred an hundred times, although he wrought in and with a true Matter) he peruſed *Artephius*, and out of that Book learned the *Secret Fire*; which if he had not done, he had remained perpetually ignorant.

From all which it is ſufficiently clear, how much it concerns an Artiſt to have knowledge of the *Secret Fire*, *Luting* of *Sapience*, or *Hermes Seal*. Our Fire is indeed inſignized with three Names, yet it is no other than one Being, *viz. Oil of Vitriol, by the fixed Sulphur of Tartar, coagulated into the form of a Stone.*

But why I here ſo clearly deſcribe an *Arcanum* of ſo great Magnificence, and alſo publiſh the ſame, I have ſeveral weighty Reaſons. Yet, in the mean while, I am not at all ſolicitous or carefull thereabout, for fear it ſhould become too common, becauſe of an hundred Readers that read and peruſe the ſame, ſcarce one of them hating labour will give credit to the Preſcripts thereof; and ſome others (who loving labour would credit what is here written) yet perhaps will want the acuteneſs of a Philoſophick Ingeny, by the dexterity of which to inſtitute and abſolve ſuch a fixation. Wherefore I rejoycing in that, do confidently and ſecurely acquieſce, that the Art will not ſo eaſily be rendred familiar to every Son of the Earth promiſcuouſly without diſtinction; but Art will ſtill be and remain Art. Some years ago I did demonſtrate to the ſight of ſome of my intimate Friends the way of Preparing the *Mercury* of *Antimony*, and commended to them the Fixation of the ſame by our *Secret Fire*; but they unto this very day have never ſet their hand to the Work to elaborate it; and that perhaps becauſe it ſeemed to them to be too vile a thing, and not ſuch as was likely of that it could be prepared, a Medicine of ſo great Excellency.

Here in this Treatiſe I have taught the way of Preparing, by the help of Oil of Vitriol, a particular and famous *Salmiack*, by the benefit of which, from Metals and Minerals may be prepared, not onely an Univerſal Medicine healing all the Diſeaſes of Mortals, but alſo a particular Tincture for meliorating imperfect Metals. I have indeed ſpoken many things, but not all as yet; becauſe I there had no other intention, but onely to diſcover our *Secret Salmiack*. If I would proceed farther, I could certainly ſay, that in the moſt deſpicable Urine of Men a moſt pretious Treaſure lyes hid, although the greateſt part of the Poſſeſſors of it know nothing of the ſame; becauſe God, by reaſon of their Sins, will not impart this Secret to them. In the Urine of every Man is latent a certain living Metallick *Mercury*, which may thence moſt eaſily be extracted by the help of a certain pure Metallick Body, or by the aſſiſtance of Art be prepared into a Tincture, or Univerſal Medicine; according as we above taught, where we treated of *Mercury*.

Wherefore writing, I write and will write, that no Man in very deed can call himſelf poor, becauſe God hath conferred on every Man from his firſt Nativity ſo great a Gift, as being brought forth into the Light of this World, he may have ſufficient wherewith to live, provided he underſtands, and is able to perform what are to be performed. Philoſophers affirm, that *Adam* and *Eve* brought their *Stone* with them out of *Paradiſe*. But to us it is ſufficiently manifeſt, that they were caſt out naked, without all help and comfort. Therefore you infer they bore ſuch a Treaſure in their Bodies, as is ſeen by that of *Morienus*, who being asked by King *Calid*, In what Subject that famous Stone of Philoſophers lay hid? Anſwered; *In thee, O King, it is hidden.* And farther, ſo ſoon as he had prepared the Medicine, he writ about the Veſſel in which it was; *He that carries all things with him, needs not the help of another*: Signifying, that he needed not the help of any King, becauſe he had all things in himſelf. Having done this, he returned

returned to his Hermitage, and there bleſſedly paſſed the reſidue of his Life in the ſtudy of Temperance, Prayer and Faſting, always glorifying the Name of God. For if *Morienus* had not known that he had about him an ineſtimable Treaſure, without doubt he would not have left the King ſo ſecretly, but perhaps have waited in hope of ſome Magnificent Entertainment: yet he thirſted not after this, but going away acquieſced in that onely, which contained in himſelf, God had long before conferred on him when he entred this World. It is ſufficient for me that I have not buried my five Talents (lent me by God) in the Earth, but have reſtored them to my Lord, and have alſo ſo improved the ſame, as I have gained other five Talents.

Before I conclude, I am willing to ſay this: I have indeed received of God other five Talents alſo, but as yet have not gained five other Talents by the Uſury of them; and that not becauſe I fear the ſeverity of my Maſters Law againſt his idle Servants; but I fearing Evil from Men, durſt not make any Improvement thereof, becauſe I ſuſpect that thence a great and incurable abuſe would be ſpread far and nigh among the great number of wicked Men. Nevertheleſs, I now purpoſe to proceed in them, and that for certain Cauſes; and (with the aſſiſtance of God) as ſoon as I can to publiſh the *Magnalia* of the Almighty. Accordingly I hope this will prove a great comfort and preſent help to the whole Chriſtian Common-wealth againſt the *Turk*, the hereditary Enemy of the Chriſtian Name, [*vid. Proſper. Germ. p.* 5.] But the ſumme of things to be communicated, chiefly conſiſts in that, which certain artificial Inventions diſcover to me, by help of which many wonderfull things may be performed; and (if God ſo pleaſe) all the Neſts of thoſe Tyrannical *Hagarens* be laid waſte, and ſo the Chriſtian People be fully and plainly freed from their intollerable ſervitude. For if it ſhall be pleaſing and gratefull to the moſt wiſe God, that ſuch noble Inventions, hitherto unknown, may be divulged and put in practice; he alone hath power of procuring occaſions and means for making them publick: but if it diſpleaſe his glorious Wiſedom, in his Name the Art ſhall be buried with me, or rather be returned to Him, as to the Fountain of Fountains, from whence it flowed to me.

In the mean while, I could not chuſe but leave to Poſterity, for a Remembrance of my Benevolence, ſomething worth the minding, touching ſuch unheard-of, heroick, efficacious Inventions. But theſe are written as in a Parentheſis, and by the way. Proceeding, let us diſcourſe a little farther of deſpicable Urine.

All Men and Beaſts live of the Dungs of Animals; alſo no Corn, Wine, Apples, *&c.* would be produced, if not dunged with the Dungs of Animals. But ſome one may object and ſay, Wild Herbs, Trees, Shrubs and Reeds are not dunged with the Dungs of Animals, as Vineyards and Corn-fields. I anſwer. Thoſe Plants enjoy and have another Dunging, *viz.* Celeſtial or Rain-water, by the benefit of which in Autumn and Winter, Branches and Leaves falling off from the Trees, do putrefie, and become Dung; which kind of Dunging, in the Spring-time betakes it ſelf to the Roots of Trees, that a penetrative Dunging and procuration of increaſe may there be made, ſince the Leaves are to be eſteemed the Excrements of Trees, with which they are refreſhed and renewed. Why then may not the Excrements of Man ſerve for the Renovation of Man alſo?

No Man can deny, but that the Dungs of many Animals have been uſed in the Galenical Shops of Apothecaries, for the Compoſition of various Remedies, and are uſed at this very day. That in Urine is incited a ſingular comforting Virtue, they beſt of all can witneſs, who Shipwrackt in the Sea, have lived for certain days without Meat or Drink, and in the mean while have ſuſtained their life with the uſe of Urine onely.

Alſo, that Urine is an egregious Preſervative againſt the Peſtilence, the Maſters of Hoſpitals can witneſs this by all Men labouring with the Peſt.

Now if groſs Urine, with which ſo much impurity is mixt, be of ſo great efficacy, what may not its Spirit purified, and its volatile Salt effect, eſpecially, if before Diſtillation, the famous Eſſences of Vegetables be artificially added, becauſe ſuch Virtues of Herbs, Flowers and Seeds, Woods, *&c.* by the help of the volatile Salt of Urine, are excited through their whole Body, to exerciſe there their Virtues efficaciouſly.

Whoſoever knows how rightly to prepare, and duely to uſe Spirit of Urine, may eaſily thence get ample Riches, and reap no leſs profit in Medicine than in the Tranſmutation of Metals. Wherefore I here openly confeſs, that in this little Treatiſe I have poſited certain Proceſſes, which (as to their external face) ſeem to be of ſmall moment, yet to Men skilled in the Theory and Practice of them, they will find ſo gainfull a Work, as no Handicrafts-man whatſoever can gain ſo much by his Craft. So much gain may be hoped for from Urine onely, if rightly and knowingly handled according to the Spagyrick Art. Becauſe every one Man may gain not one, but ſeveral Imperials by that Art: the Proceſſes of which are diverſe, and that by the onely help of deſpicable Urine. Hence are thoſe frequent complaints of Ancient Philoſophers, that their Matter of the Stone is caſt away by Fools among Dung trod under foot and contemned, which notwithſtanding ought to be honoured by every Man. I ſay, by *Every Man*, becauſe from it the Philoſopher extracts his Univerſal Medicine, and the Phyſician his particular Remedies. For the Chymiſt tranſmutes vile Metals into better, and ſo conſequently every Mechanick Operator may expect ſome Fruit from the ſame. Wherefore Urine is not to be deſpiſed, but to be taken into uſe; inſomuch, as every drop of it that is ſpilt ſhould be bewailed. Yet I proteſt I would not diſcover this, but for the ſake of thoſe that have Ears to hear; becauſe other Men naturally deaf to ſuch things, can reap no profit by this my Doctrine, becauſe *Hippocrates* forbids to give Medicine to thoſe that are paſt hope.

Whatſoever are here related touching Urine, may be ſaid of the black ſhining Soot of Chimnies, of the Hairs and Horns of Animals, of Egg-ſhells, and the like, and eſpecially of the Fæces of Wine, which are caſt away after the Spirit is extracted.

But perhaps ſome Man may here ſay, Our Secret *Sal-Armoniack* is too coſtly to be uſed for the preſcribed Operation. To him I anſwer. No Man can gain ſomething for nothing. But whoſoever is deſirous to reap ſome Eminent Benefit, he muſt firſt ſow ſome pretious thing.

Indeed I confeſs, one pound of our *Salmiack* (if a Man onely follow the literal Senſe, or bare letter of

the Deſcription) will coſt ſeveral Imperials, becauſe for one pound of Oil of Vitriol prepared, four or ſix pound of Spirit of Urine are required for coagulating the Oil with the ſame, which notwithſtanding, in reſpect of thoſe famous things which are acquired by the benefit of it, it is not to be judged coſtly. If a Man cannot prepare his Spirit of Urine, and Oil of Vitriol himſelf, but muſt buy them of another, he then indeed may complain of Dearneſs. But to one perfectly well skilled, the *Sal-Armoniack* will coſt him little more than his manual Labour, inſomuch as no Man hath any juſt cauſe to complain of charges.

If the divine Grace ſhall be pleaſed to prorogue my Life a little longer, I purpoſe to publiſh greater *Arcanums*. Therefore let God do as he pleaſeth, his Will is always beſt, and better than the beſt Wills of all Men. *Amen.*

A Corollary.

Well-meaning Reader,

IN this ſmall Treatiſe I have in few words revealed great Secrets, ſuch as were known to no Man before me, except Paracelſus, *who very briefly ſpeaks of the chief of them. And* Heimont, *touching the great Virtues of that, hath writ many things. And ſince my* Sal-Armoniack *performs the ſame in all Operations, which* Helmont *aſcribes to his* Alcaheſt, *I am able to aſcribe ſomewhat more to my* Sal-Armoniack, *than he aſcribed to his* Alcaheſt, *yea, many things, which may profitably be performed by the benefit thereof, among which the chief is this,* viz. *that by help of it all Metals and Minerals may be reduced to their firſt Matter, that is, into a* Spiritual Mercury, *which is the higheſt Magiſtery in Chymiſtry.*

I, in this little Book, have onely preſcribed a few ways of preparing Medicaments, and that in a Laconick-Style, becauſe I writ theſe things in my Sick-bed. Indeed I could willingly and gladly forbear Writing, both now and heretofore; for by all that ever I writ, I never gained one half-peny. But Chriſtian Charity inflamed me to conſecrate this great Arcanum, *and the fruitfull uſe thereof, (before I dye, knowing in the Grave nothing can be done) and to publiſh the ſame for the good of Mankind remaining in the Earth; being full of great Hope, there will not want ſome Religious Spagyriſts conſcious of Piety, that will prove themſelves faithfull diſpoſers of this bequeathed Gift, and heal the Diſeaſes of the Poor* gratis. *But if the great troop of Malignant Spirits preſume to abuſe the Practicers of this moſt noble Art, they may find* Nemeſis *ready ſwiftly to puniſh them.*

Every one, as he pleaſeth, may prepare moſt preſent Medicaments. For all Herbs, the way is almoſt one. Alſo in reſpect of Animals, Minerals, Metals and Stones, you will find but little difference. Every Man may himſelf more profoundly ſearch into the Art. For my own part, I am at preſent ſo weak, as Strength faileth me to proceed farther in this diſcourſe. Therefore, by every good Man, I ſhall be readily excuſed, becauſe I have given ſufficient occaſion of ſearching into other high Secrets. If this my benevolent Communication ſuffice not any Man, he may himſelf ſearch farther elſewhere. For it is eaſier to add to things already found out, than to become the firſt Authour of new Inventions.

I had purpoſed in this little Book to ſignifie the moſt fruitfull uſe of my Secret Alcaliſate *Spirit of Wine; which is ſo great a Secret, as no Man before me did ever diſcover to the World; but my Sickneſs hath prevented and hindred the doing of that. If God prolong my Life, that may be done in another ſmall peculiar Book.*

Truly, I highly prize my ſecret Sal-Armoniack, *yet I more eſteem the uſe of my Spirit of Wine Alkalizate; that being a Spirit of ſo great potency, as from all Minerals, Metals and Stones, it extracts a moſt pure Tincture, and by Alembeck brings the ſame over the Helm with it ſelf. What ſhall I ſay? Even fixed Gold it ſelf cannot reſiſt it, but ſuffers it ſelf without a Corroſive (like ſweet Water coloured yellow with Saffron) to be drawn upwards. In a word, this Alkalizate Spirit of Wine is an admirable Inſtrument for a Phyſician, of it to prepare efficacious (yea incomparable) Medicaments; and he may eaſily acquire abundance of it, and that for no more charges, than after the common manner any other common Spirit is prepared. He that ſeeks ſhall find. Wherefore riſe from your ſoft Pillows, and with ſmutted Hands touch black Coals, and accurately give heed to the inſtitutions of Art. For with Idleneſs, Eating, Drinking, and playing on Muſick, you ſhall never approach to great Myſteries. I would have you always think of this that is now once ſpoken. It is indeed impoſſible for a moſt unskilfull Man to believe or comprehend, how great things may be prepared by help of this burning Spirit.*

About the end of the Preface of this Treatiſe, I mentioned ſome few things touching the ſame; viz. *that of good burning Spirit, with little labour and no great coſt, in a very eaſie way a true univerſal Medicine for humane and metallick Bodies might be made. This I would have no Man to doubt of, but to account of as moſt true. For I now ready to be laid in my Grave, have great need to be very carefull how I divulge any thing, unleſs ſuch pure verity as experience hath taught me. If the moſt wiſe God will prolong my Life untill the next Summer, and enable me to write out of Bed, my purpoſe is to publiſh ſome other new wonderfull Works; but if in the mean while I be taken away from the number of the living, then (candid Reader) kindly accept of theſe few things here written.*

This being thus imparted to all diligent Chymical Operators (whom I here ſalute and bid farewell) I wiſh a Divine Benediction in this Life, and Eternal Glorification hereafter. Amen.

Glory to GOD onely.

The End of the Seventh Part.

THE

THE FIRST APPENDIX TO THE SEVENTH PART OF THE Spagyrical Pharmacopœa.

In which is contained, how many, yet greater, Secrets may be prepared by the *Alcaheſt*, or Secret *Sal-Armoniack*, than thoſe which are mentioned in the Seventh Part of the *Spagyrical Pharmacopœa*, viz. how Vulgar Mercury may be firmly fixed, and rendred totally conſtant in Fire, within the ſpace of three Days. Alſo an Explanation, how by the benefit of it may eaſily be acquired the Mercury of Wine, as the higheſt Medicine of the World. Likewiſe, that the Secret Fire of the Wiſe, otherwiſe called the Fire of *Artephius* is the ſupreme Secret of Secrets: Together with a Revelation of other admirable Secrets, of which the Authour hitherto hath made no mention to any Man.

To the Well-meaning READER.

I Could not forbear to ſignifie to the Lover of divine and admirable Works, the Reaſon of my former omiſſion or ſilence; namely, why in a little Treatiſe of mine lately publiſhed (which is intituled The Seventh Part of my Spagyrical Pharmacopœa *) in which I treat of my Secret* Sal-Armoniack *or Liquor* Alcaheſt, *I ſo ſuddenly broke off the Thread of my Writing begun, before I had any thing largely diſcourſed of the eminently excellent Vertues thereof, which it manifeſts not onely in Medicine, but alſo in Tranſmutation of Metals. Therefore, the Reaſon of my abrupt Ceſſation was as follows.*

Before I had compleatly finiſhed the afore-mentioned ſmall Treatiſe, I was aſſaulted with a grievous Diſeaſe, which incredibly prevailed more and more daily, inſomuch as I totally deſpaired of recovering my Health, and therefore thought it neceſſary, that whatſoever was then written (how imperfectly ſoever) ſhould for the ſake of the Poor and Diſeaſed be committed to the Preſs. But ſo ſoon as by the mercy of God, I was in ſome ſmall meaſure recovered, I peruſed that little Book, and preſently diſcerned, that the moſt powerfull faculties and virtues which that laudable Liquor is able to exerciſe and manifeſt both in Medicine and Chymiſtry, were ſcarcely in any-wiſe treated of, but almoſt wholly omitted in the ſame Book. Hence many conceited Men perſwade themſelves, that my Secret Sal-Armoniack *cannot be of ſo great Energy or Virtue, as* Helmont *aſcribes to his Liquor* Alcaheſt; *eſpecially becauſe He, in the Coagulation of* Mercury, *ſaith, that the ſame (when his Liquor* Alcaheſt *hath been but once abſtracted from it) is ſo fixed, as a pound of it being tried by Cupell, leaves behind, after Trial, fourteen Lotones of good Silver; which indeed is not to be eſteemed*

esteemed a vile Experiment, viz. *that by so very little Labour* (*as is one onely abstraction of the* Alcahest, *which may be done in a few hours*) *such a volatile, and that the sole Deluder of all* Alchymists *should be transmuted and nobilitated into a fixed Metal, tractable and perseveringly sustaining every Examen of Fire; and that by mediation of such a substance, as the Liquor* Alcahest, *which* per se *is no other than a volatile Salt. Nevertheless, it is found, that the same may be done, and that not onely common Mercury, by our Secret* Sal-Armoniack (*which otherwise rendreth all fixed Metals volatile, and separates the most pure Souls or Tinctures of them from their gross Bodies, and carries the same over the Helm with it self*) *is transmuted into Silver; but also the same is endued with a Faculty of transmuting other imperfect Metals into good and constant Gold. The Truth of which Assertion I have not gathered out of the Writings of other Authours, but have learned the same by the continual Industry and Experience of my proper Inquisition; and therefore am able so much the more confidently to assert somewhat my self, touching the same, to every ingenious Man.*

But that you may know the Reason why Volatile Mercury, by my Secret Sal-Armoniack *also volatile, is rendred fixed and constant in Fire; you are to understand, that this onely is effected by the cleansing power and virtue of our* Salmiack: *for in Vulgar Mercury is somewhat ingenited by Nature, which makes the whole Body of it volatile. Now if any one doth well understand how to separate that therefrom by an Artificial cleansing, the flying Mercury no longer remains volatile, but assumes to it self an hard fixed, tractable and Metallick Body; in which kind of Purification to be made, our* Salmiack *performs the office of a Master. Whence happens such a speedy fixation of Mercury; touching which we, in the following Praxis, shall more amply treat and demonstrate the same*, viz. *that so swift a Coagulation of volatile Mercury into Gold and Silver constant and abiding in Fire, is not to be accounted a vile work of small value, but to be esteemed as one of the principal* Arcanums *of Nature. This needs no proof, because by the sentence of all experienced Men it is long since notoriously known, that this noxious Deluder* Mercury, *by its volatility, hath deprived some thousands of unwary* Alchymists, *not onely of their Gold and Silver, but also of their Houses, Lands, Towns, Vineyards, Fields, Meadows, Gardens, and all their other Goods, carrying the same with it self up the Chimney, and leaving them nothing but an heap of broken Pots, Cucurbits, Glasses, Soot, Dust and Ashes, instead of the wealthy Spoils and rich Reward they thirsted after with vain hope. But as he hath evilly intreated the unskilfull and unwary Slaves and Drudges of Chymistry, so he hath dealt well with experienced and wary Philosophers, who (after they had observed his Inconstancy, and learned to amend the same) were such as he was constrained to obey, insomuch as they could subdue, bind and fix him. This is no Fiction or fabulous Tale, but a Truth which may be proved by many hundred true Histories, declaring, that in various parts of the World have lived those who were able to fix Mercury into a constant permanency.*

Of the more ample Use of our Salmiack.

HAving in the precedent Treatise omitted the best and most worthy use of our *Salmiack*, (*viz.* that by the benefit of it *Mercury* might be so purified, as to be very easily fixed into a Red Body fixt and constant in Fire) I was incited and moved thereby to commit this *Appendix* to the Press; especially because in doing the same, I could also upon every opportune occasion notifie several other profitable Secrets, which may be perfected by help of that; as here following you shall perceive, they being inserted one after another.

Therefore incline your Ear to hear what admirable Effects our *Salmiack* is able to manifest both in Medicine and Alchymy.

First, Our Secret *Salmiack* not onely purifies Metals, and separates the pure part from the unprofitable gross Bodies of them, but the Volatile parts it carries upward with it self; and afterward suffers it self to be again fixed [with them] into fixed Tinctures, as already in the precedent Seventh Part of our *Spagyrical Pharmacopœa*, we have very sufficiently proved, as well as in our Treatise of the *Three Principles of Metals*; but also it is endued with a power of carrying over the Helm the most fixed Gold, without any Corrosive, like to a yellow sweet Spirit, and of converting the same into true *Aurum Potabile*: for such *Aurum Potabile*, without a Corrosive adhering is found to be, not onely an efficacious, sweet and famous Medicine for humane Bodies, but also a true Tincture for transmuting imperfect Metals into better.

It is indeed a very great Question how such Gold can be a Tincture for other more vile Metals, since common Gold (according to the Opinion of many Philosophers, and the experienced truth of the matter) *per se* contains in it self no more Tincture than is sufficient for it self, and without prejudice to its own virtue or nobility is able to communicate no good to other Metals. Nevertheless, Philosophers more acute, narrowly sifting the matter, have found that vulgar Gold, by the assistance of Art, may be destroyed, and its inside turned outward, but its outside inward: for such destruction Philosophers have called *Exaltation*, intimating, that the Exaltation or Melioration of Gold must be made in the Sign *Aries*; to which assertion I could never assent, but always believed and urged the contrary, inveighing earnestly against *Toletanus*, who writ *Animadversions* upon that good Philosopher of ancient Repute *Bracescus*, as if he had been a dull and obstinate Man, teaching in his Treatise of the *Tree of Life*, that the Universal Medicine might be prepared of vulgar *Mars*; for it not a little troubled me (after by a previous and

and continued ſtudy of reading and peruſing the beſt Authours, I at length by the Grace of God, in my ſearch found and learned the way of making ſuch a Tincture and Medicine) that the ſaid *Toletanus* did ſo unhandſomely heighten his Style againſt the laudable *Braceſcus*, and contemned the famous Induſtry of that man, inſomcuh as I have, in ſome of my Writings (although with a certain Zeal, which I ingeniouſly confeſs was unſeaſonable) chaſtized this *Zoilus*, becauſe he with an impertinent Preſumption did ſo raſhly and arrogantly attempt to oppoſe and contradict that, which he himſelf had not ſufficient Experience of. But it happened, that afterward ſuch an Exaltation of Gold fell into my hand unexpectedly. Whence, ſeeing ſuch an Exaltation of Gold to be true, I repented my own folly. VVherefore now I openly confeſs, that by the help of our ſecret *Salmiack* I have very often elaborated ſuch an Exaltation of Gold in the mineral Aries; although in a very ſmall Quantity, finding that to be ſufficiently imbibed with the Colour of Gold, whenſoever onely two or three Grains of ſuch exalted Gold were mixed with a whole Pound of common VVater. But in metallick Tranſmutation, during theſe days of my indiſpoſedneſs, I could never yet try any thing further. If the moſt wiſe God, ſhall be pleaſed to reſtore and raiſe me out of my ſick Bed (as I hope this next Summer he will) I will not omit to try what the aforeſaid exalted Gold is able to effect in the Tranſmutation of Metals. In the mean while I am perſwaded, that it will prove an amply potent Tincture for *Mercury* and *Luna*, and thence I divine becauſe two or three Grains of ſuch exalted Gold do tinge a whole Pound of VVater with a golden Colour that the ſame muſt be done with *Mercury* and *Luna*. Therefore no man hath cauſe further to doubt, that common Gold, by the help of our *Salmiack* in Aries, may be reduced into ſome one true and fixed Tincture; as here following (God willing) ſhall be ſhewed more at large.

Of the more largely fruitfull uſe of our Sal Armoniack *in Medicine and Alchymy.*

MY Preface to the ſeventh Book of my *Spagyrical Pharmacopœa*, mentioneth how the *Mercury* of Wine may be ſeparated from any pure burning Spirit, and perform the Office of an univerſal Medicine healing men and metals. But ſince in ſuch a manner of preparing the Medicine as I there preſcribed, very little *Mercury* of Wine will be gotten, not enough to ſatisfie thoſe, that deſire more abundance, becauſe from one Pound of Spirit of Wine, ſcarcely three, four or five Grains of moſt pure Cœleſtial Salt are extracted; which nevertheleſs is not to be eſteemed ſo exceeding ſmall a quantity, if any one ſhall with a more accurate ſearch of his mind well weigh the incredible medicinal Vertues thereof, which it manifeſts and exerciſeth againſt humane and metallick Diſeaſes; inſomuch as (in either Faculty) in the whole nature of things you ſhall find no Medicament like unto it. Certainly it is a true Cœleſtial Medicine, in the form of a certain white ſweet Salt, for if one onely Grain of it be taken into the Body of a Man diſeaſed, he will thereby be notably comforted in all his Members, and amend and find himſelf better in a moment. I muſt needs confeſs, that I have not long ſince found out the Preparation of the ſame (during the long continuance of my Diſeaſe) by various Speculations; and when by reaſon of my Sickneſs I could not riſe out of my Bed to prepare this noble Medicine my ſelf, I committed the ſame to the hands of my faithfull and truſty Friends to be by them prepared, but in a very ſmall quantity: For I cauſed not above two or three Pound of Spirit of Wine to be burned, and thence could not acquire much *Mercury*; nevertheleſs I found ſo much therein, as ſufficiently to content and ſatisfie my mind as well in Medicine as in Alchymy; believing, as I have above mentioned, that no Medicine more excellent than this can be found in the whole nature of things. Moreover, every one may conſider with himſelf, how great Salubrity ſuch a Cœleſtial Medicine may beſtow and confer on the ſick Bodies of Men, as often as he accurately weighs with himſelf the Subject (*viz.* Wine) of which this Medicine is prepared. For it is known through all parts of the World far and nigh, that under the Sun is not given a more excellent Cordial Subject, than good and pure Wine; although that abound with many inefficacious Humidities, and other Tartarous Feculencies, whereas on the contrary the *Mercury* thereof is moſt pure, or a ſweet Cœleſtial Salt is extracted from good Spirit of Wine deduced to the higheſt purity. But ſome one may ſay, what Spirit of Wine? If in that ſuch a noble *Mercury* be latent, and the ſame as it is in it ſelf be given for comforting the Sick, what need is there, that it being kindled ſhould be burnt; and why may not (without that labour and charge) its volatile Salt be received in a Refrigeratory? In anſwer hereunto let him know, that Spirit of Wine is almoſt all a mere Sulphur, and therefore is eaſily inflamed and devoured with the Flame, as is common to every Sulphur, *viz.* that ſo ſoon as it is ſet on Fire, it conſumes it ſelf, and leaves behind it no other than Aſhes and a fixed Salt; but the *Mercury* which adhered to the Sulphur, is diſſipated in the Air with the Flame, unleſs it be taken in a Cold Receptory, in which it may cool and condenſe it ſelf. Indeed we for certain know, that no one of all the three Principles of Vegetables, Animals and Minerals is totally pure, but it always inviſibly bears about it ſelf ſome ſmall part of the other two Principles, as may beſt of all be ſeen in combuſtible Entities, ſuch are Wood and other Vegetables; for they being kindled and ſet on fire, the Sulphur is onely burnt, but the other two parts, *viz.* the fixed Salt, and the volatile *Mercury* remain free from Combuſtion. As for Example, if you burn Wood, an Herb, or any other kind of Vegetable, the Sulphur onely periſheth, but the *Mercury* adheres to the ſides and walls of the Chimny. If you thence ſeparate the Aſhes and other Filths, which fly together upwards, you will obtain a white volatile Salt, altogether like the Animal volatile Salt of Urine, except in this onely, that this volatile Salt ſavours of Aduſtion. The fixed Salt is extracted out of the Aſhes by Elixiviation of common Water. Moreover Animal Entities being burnt, *viz.* the Bones of any Animals; the Sulphur is onely burnt, but the volatile Salt flies away, and almoſt no fixed Salt remains in the Aſhes. Laſtly, common mineral Sulphur being burnt, almoſt all the Sulphur vaniſheth into Air like a Flame, and together with the Flame an unburnable *Mercury* aſcends, in form of an heavy Corroſive Oil, which by Chymiſts is vulgarly called Oil of Sulphur, and is received in Glaſs Campanes; nevertheleſs that Oil is by Philoſophers named the *Mercury* of Philoſophers, becauſe ſuch Oil is eaſily tranſmuted into a

ſweet Fuſile Stone, of which my lately publiſhed Treatiſe of the Salt of Philoſophers makes ſome mention. From all which you may clearly gather, that there is no Sulphur found ſo pure, but that it is impregnated with ſome ſmall part of Salt and *Mercury*; alſo you can find no *Mercury*, in which is not incited ſome part of Salt and Sulphur; and in like manner no Salt, to which a little Sulphur and *Mercury* adheres not. Which being thus, why may there not latently be in Spirit of Wine an incombuſtible Salt and *Mercury*? And as Spirit of Wine duely rectified according to the Precepts of Art, is found to be the pureſt of all other Sulphurs, and endued with no Feculencies; ſo alſo neceſſarily, when that Sulphur is kindled and burnt, with the Flame muſt needs aſcend as it were an unburnable Subſtance, which may be received in a Refrigeratory for amending humane and metallick Bodies. Whoſoever cannot comprehend and believe theſe, he truely and condignly may be called a Blockhead, although by his Flatterers (men very indiſcrete) he be accounted even the Eighth of the Wiſe wen, or a ſecond *Paracelſus*.

I purpoſed in my mind to communicate this ſupream Medicine to ſome candid Friends, that ſome preſent Medicine may thence be made, by the ſalutary help of which, I alſo in this my declining Age, and in the Diuturnity of my Diſeaſe, may be made partaker of ſome Relief, ſince I my ſelf now ſick in Bed, am able to prepare nothing.

Indeed I did formerly reveal this ſo very great Myſtery to ſome of my old Friends, and that to the end that they being ſound and in health might labour therein, and after their Work was ended (which might be compleated in Eight days) communicate to me, as an Offering of thanks, ſome ſmall part of that Medicine, that my old infirm Body might be comforted; but their intent was far otherwiſe: For theſe rude men would not ſuffer me to participate of one Grain of the Medicine revealed, nor ever came within my Doors ſo much as once, after they were fully and plainly inſtructed in the Art by me taught; but paſſed by as if I had been a man wholly unknown and never ſeen by them. But this was to me a very juſt and truely deſerved Recompence, becauſe I being too credulous, did ſo vilely caſt into the Mire the moſt noble Pearl of all Medicine, not conſidering the faithfull admonition of the ſupream Maſter: Beware of Men.

I muſt needs confeſs that it is not a Work for covetous men; becauſe ſuch thirſt after nothing elſe, but a great Maſs of Gold, and think this moſt noble Art to be no other than a rotten Thread. In like manner I do alſo confeſs, that common Spirit of Wine gives forth from it ſelf but a very ſmall quantity of ſuch Cœleſtial Salt; yet a great quantity of the ſame no man hath need of, becauſe the power and efficacy thereof ſhews it ſelf far and nigh. If any one be deſirous to acquire to himſelf a greater quantity of this our Cœleſtial *Mercury*, he may obtain his deſire, if he make uſe of a good medicinal Reſtorative Subject, as Sulphur or Antimony fixed to a Redneſs, alſo Gold, Pearls, red Corals, caſt Skins of Serpents, *Boletus* or *Fungus Cervinus*. If theſe and the like reſtoring or renovating things be extracted with Spirit of Wine and the ſame Wine burnt: becauſe in doing that, with the Flame will aſcend a moſt pure mercurial Salt, which muſt be received in a cold Recipient.

In like manner all Metals, when they are duely extracted with Spirit of Wine, do in burning give forth from themſelves a volatile mercurial Salt, which may profitably be adminiſtred, as well in Medicine as in Chymiſtry. For the Salt of *Saturn* is a moſt preſent Peſtilential Remedy; the Salt of *Venus* an efficacious Venereal Medicament, the Salt of *Luna*, a moſt excellent Cephalick, the Salt of Gold a famous Cordial, and the Salt of *Mars* an admirable Stomach Remedy, and a true Tincture, by the help of which vulgar *Mercury* and *Luna* may be tinged into Gold. But it cannot profitably be adhibited in metallick Labours, unleſs it be firſt reduced to a red Fixedneſs by the benefit of common Gold, being ſuch, as after the firſt Preparation may be very eaſily fixed and rubified; although it all aſcends in a white Flame, and the Preparation be from a red Subject. For it is fixed and waxeth red, if any one do from it but once abſtract the Water of *Saltaberis*, as *Paracelſus* calls it. But if you ask what *Paracelſus* his Water of *Saltaberis* is, it is not my purpoſe at this time to publiſh and divulge that kind of Water. *Helmont* vaſtly erred, when he thought it to be the Water of Whites of Eggs, which it is not, but it is a Water preparable for a very ſmall Price, as much as is ſufficient.

In the mean while, no unskilfull Man is able to believe, with how great a property of purging, elevating and fixing the Flame of good Spirit of Wine is endued. Therefore, whoſoever is deſirous of knowing this, by putting his hand to the Work let him make Trial. The Flame of this burning Spirit renders all corroſive and bitter metallick Subjects ſweet and pleaſant; therefore *Lully* rightly ſaid: *The immature Bitterneſs is to be dulcified, that the whole Magiſtery may be obtained.* Briefly I ſay, by the benefit thereof, ſo great good may be performed as is difficult to be believed, unleſs any one before he ſets about the Work hath beheld the Event. In which at preſent we acquieſce, yet out of an abundance ſhewing this, *viz.* that, whenſoever any man hath a mind to ſubtilize metallick Subjects by a burning Spirit (diſtilling or ſubliming them into ſweet Salts or Tinctures) he is obliged by no neceſſity at all, to uſe no other than Spirit of VVine onely; becauſe a burning Spirit of Corn, or extracted out of other Vegetables, will do the ſame. But whoſoever would without Metals acquire a ſweet medicinal *Mercury per ſe*, he muſt prepare that of the Spirit of ſweet VVine; becauſe other Vegetables afford not ſo much mercurial Salt as may be had from Wine; which is to be kept in mind as a thing worthy of Obſervation.

Thus have I here clearly revealed as high a Medicine as ever was or can be found in the Nature of things; which no one of the Philoſophers before me did ever preſume to do. Indeed *Albertus Magnus*, and his Diſciple *Thomas Aquinas* have written of it ſomewhat more clearly than others, yet ſo, as few Readers can follow the mind of them. For they do indeed make mention of Spirit of VVine, yet the Inſtrument under which it is to be burned, they did not in any wiſe expreſs, or hint at. *Baſilius* taught that the Inſtrument was to be made of Copper; yet this kind of Inſtrument is not every way conducible, but there is ſome defect in it. As for my ſelf, I long ſought with earneſtneſs, before I could find a fit Inſtrument, in which I might receive this Cœleſtial Salt and *Mercury*. Let others after me alſo make the like ſearch, till they find. It is not my buſineſs at all times, to caſt all things at the Feet of the unworthy. For I am forbid by the Fates, having already

divulged

divulged more than enough. But whoſoever is deſirous of learning more touching this kind of labour, let him peruſe *Braceſcus* in his Treatiſe of the Tree of Life, touching our mercurial Water, where he may find things enough worthy of note to yield him content. *Avicen* indeed writes alſo excellently, but very briefly. *Coſmopolita* and *Neuſementius* have writ ſomewhat more clearly in their Books, yet with ſo Philoſophick a Character, as ſcarcely one among a thouſand Readers ſhall there find what he ſeeks. More at this time touching this it is not lawfull for me to diſcourſe; but of other things here to be treated of, let every one comment and meditate what he thinks good.

Of the further uſe of our Salmiack.

IN my lately publiſhed Treatiſe of the three Principles of Metals, I ſhewed how by the help of *Proſerpina* the Wife of *Pluto*, a tinging Oil of a ſanguineous Colour might be diſtilled from the Vitriol of *Mars*, and thence be coagulated into a ſweet Fuſile Stone, by the benefit of which great things may be effected in the Tranſmutation of Metals and Gems. But what is underſtood by *Proſerpina* I conſiderately concealed from the Reader, as well as the Coagulation of the red and white corroſive Oil of Vitriol into a ſweet Stone, becauſe at that time I purpoſed not to publiſh any thing more thereabout. After that Publication, certain Rivals of our Art came to me very earneſtly intreating, that I would alſo reveal to them *Proſerpina* and my Coagulation of Vitriol: Theſe men by their perſwaſive Intreaties ſo ſoftned my mind, as I was freely willing to gratifie them, but with this Condition, *viz.* that ſo ſoon as they had elaborated the whole Work, they ſhould impart to me ſome ſmall Portion of that Medicine, yet this promiſe of a thankfull acknowledgment hath not untill this day been fulfilled, wherefore I on the other hand fearing that ſo great a Secret (*viz.* how by the help of *Proſerpina* the tinging Oil of Vitriol of a ſanguineous Colour, tinging *Luna* into Gold, might afterward be coagulated into a Fuſile Stone) ſhould be expoſed to publick view by thoſe, that were ſo ungratefull to me, was reſolved I would my ſelf be the Publiſher of ſo great an *Arcanum*, knowing always, that the Maſter is better able to diſcourſe of his own Work, than the Diſciple; not in the leaſt doubting, but that by this Revelation or way of diſcovery, many Alchymiſts, reduced almoſt to the extream neceſſity of *Irus*, and ready to periſh, will be able to recover themſelves, and obtain their priſtine repute among men. Therefore touching the Diſcovery of this *Arcanum* thus take it.

By *Proſerpina* in the afore mentioned Treatiſe is underſtood the corroſive Oil of Antimony, or in defect of that Butter of Antimony, which (when added to Vitriol of *Mars* in like Proportion, and diſtilled by Retort) carries over with it ſelf the Gold of Philoſophers or Tincture of *Mars*, in form of a thick Oil of a ſanguine Redneſs; which red Oil, when coagulated into a ſweet Fuſile Stone, will be very available in the Emendation of Metals, eſpecially in tinging *Luna* into good Gold, as a little after you ſhall hear. Theſe are briefly ſpoken touching the Antimonial *Proſerpina*: Here following it ſhall be ſhewed by us, how our Secret *Sal Armoniack* may profitably be uſed inſtead of the Antimonial *Proſerpina*, after we have premiſed the way of coagulating the red Oil of Vitriol into a Stone not corroſive, by help of which Metals may be amended variouſly. As to the Coagulation of the red and white Oil of Vitriol, and alſo of other corroſive Liquors, that indeed is very eaſie to accompliſh, but hard to find out. For all Philoſophers have very obſcurely writ of this kind of operating, in ſuch a Laconick manner: Diſſolve and Coagulate. The Solution of *Mars* into Vitriol is made by the help of common Oil of Vitriol, or elſe by Spirit of Salt. But the Coagulation into a tinging Stone not corroſive is made by the help of old, cold and dry *Saturn*, becauſe he it is, that underſtands how with his own moſt intent Coldneſs and Dryneſs to extinguiſh all humid coldiſh Fires, and to change them into hard Stones.

No one of the Philoſophers hath writ more clearly touching the Coagulation of mineral Spirits, than *Paracelſus*, in that Treatiſe which is intituled the Heaven of Philoſophers, being that in which he treats of the Nature and Properties of the ſeven Metals, and in the Fifth Chapter of *Saturn*, he thus ſpeaks.

Canon the Fifth, touching the Nature and Properties of Saturn.

SATURN of his own proper Nature thus ſpeaketh.

The ſix other Metals have caſt me out for their Examinator, and have thruſt me from themſelves out of the Spiritual Place: They have given into my Manſion a corruptible Body, that I might be what they neither are nor deſire to have. My ſix Brethren are ſpiritual, thence it is, that they penetrate my Body as often as I am burned in the Fire; and together with me they periſh in Fire. Sol *and* Luna *onely excepted, which are cleanſed with my Water and wax proud. My Spirit is a Water ſoftning the rigid and congealed Bodies of my Brethren. Yet my Body tends to the Earth; whatſoever is received into me, becomes alſo conformable to us, and by us is converted into one Body. It would not be profitable for the World, if it ſhould know or could believe what are latent in me, and what I am able to effect. It would be more profitable for the World if it underſtood that, with me, which I am able to do: Then leaving all Arts of Alchymiſts, it would uſe this onely, which in me is, and by me can be done. The Coldneſs of a Stone is in me; this is the Water, by which I cauſe the Spirits of the ſix Metals to be congealed into one corporeal Being of the ſeventh, that is, to augment* Sol *with* Luna.

Theſe I have tranſcribed word for word out of *Paracelſus*, that by them it might be ſufficiently maniſeſt, that he knew how to perform the Coagulation of ſharp mineral Spirits by cold and dry *Saturn*, becauſe touching that he ſo evidently writes, as he that writes moſt plainly cannot deſcribe the ſame more clearly, although there have been very few men, who did rightly underſtand this Prince of Philoſophers, and could by his words learn the Coagulation of ſharp mineral Spirits there touched, although in a particular Tranſmutation of Metals no method more eaſie can be given than by our Salt of Philoſophers, which from red Oil of Vitriol is coagulated by cold *Saturn*. I will not paſs over in ſilence, what Fruit may otherwiſe be reaped by the Benefit of this in the Emendation of ignoble and very pretious Stones; becauſe by that kind of labour more profit may be gained by ten Fold, than in the Graduation of Metals into *Sol* and *Luna*; for our red Stone exalts all Gems in their Colours, and tingeth white Cryſtals into all kind of Colours; in which Work, there

there is not any of the Off-ſprings of the Earth able to do the like. Wherefore the Ancient Philoſophers more eſteemed this Coloration of Stones, than the Art of tinging Silver into Gold; For ſuch a Stone not onely amends Metals, but alſo graduates ſmall Stones noble and ignoble, and tingeth them into better ſhapes and colours. For more excellency and good lies hid in deſpicable Lead, than any unskilfull man is able to imagine or can perſwade himſelf to believe; becauſe the Inſide of it is no other than mere Gold, inſomuch as Philoſophers have called it Leprous Gold.

So ſoon as this impure Gold ſhall be impregnated with the Antimonial Oil of Vitriol, and both conjunctively coagulated together into a red Stone, thence muſt neceſſarily be made a Tincture for Metals, as well as for Stones. Much more ſhould here be ſpoken touching our coagulated red Oil of Vitriol: But to what purpoſe is it to bring a ſample of beautifull Colours before the Eyes of a blind man, being ſuch as he cannot ſee, nor is able to judge any thing of. [See this Proceſs plain in *Proſerpina.*]

In the ſeventh Part of the Proſperity of *Germany*, mention is made of a like Coagulation of ſharp Spirits, wherefore I would refer every ſtudious Lover of curious Arts to the peruſal of that part. For what are here briefly treated of, are there more copiouſly handled, as every Reader may find, and apply to his proper Benefit. Time now admits not a more ample Diſcourſe in this place, touching ſuch ſharp Spirits of Salt.

A Furthur Uſe of our Salmiack.

FIrſt, vulgar *Mercury*, by the help of our Secret *Salmiack*, may be ſo purified in the ſpace of one Day, as the day following by one onely abſtraction of the Water of *Saltaberis*, it may be coagulated into a red fixed Medicine. Which ſwift Mortification, Coagulation or Fixation, was highly eſteemed by *Paracelſus* and *Helmont*. This *Mercury*, *Paracelſus* inſignized with the Title of *Coralline Mercury*, and celebrated the ſame with this illuſtrious Praiſe, *viz.* that in the whole Nature of things, there was not any Remedy more excellent for yielding relief in the Gout and French Diſeaſe; adding, that it recreates the mind of the Artiſt, becauſe it hath entrance into Gold, and with the ſame is converted into Gold, and ſo not a few impoveriſhed Alchymiſts may again be ſtored with Riches. But ſince the Death of this Philoſopher, you ſhall not find that there hath been one or other of the Profeſſours of Chymiſtry unto this day, who could prepare ſuch a red fixed *Mercury*; the Reaſon hereof is, becauſe none of the Sons of Art could comprehend the Water of *Saltaberis*, by which *Mercury* is to be brought to a fixed Redneſs, none I ſay, untill *Helmont*, that moſt learned Philoſopher of our Age diſcovered himſelf, witneſſing that he alſo could prepare ſuch *Mercury*, which he inſignized with the Name of Horizontal Gold, affirming it would ſufficiently ſupply whatſoever the Phyſician and Chyrurgeon ſhould need.

In like manner, that moſt expert Philoſopher *Nuyſementius* did write of ſuch a *Mercury*, teſtifying, that two or three Grains of it onely being taken in ſome Confortative, would purge out all Impurities from the humane Body. Indeed *Helmont* expreſſeth this in other words, yet by them intimates, that it purgeth out all Filths from the Veins. Behold three famous men, ſerving inſtead of the *Marpeſian* Columns of all Hermetick Philoſophy and Medicine; for they have excellently writ of this *Mercury*; yet to the Inventions of theſe, none of their Succeſſours have added any thing, but have been ſtill and quiet, ſhunning the labour of preparing an Univerſal Medicine. During the eight Months I was detained in my ſick Bed, by reaſon of my Infirmity, occaſion was offered me of a more ſerious Meditation of ſuch abſtruſe things, inſomuch as I at length found the Water of *Saltaberis*, by the help of which I totally fixed *Mercury*, not indeed as *Helmont* ſaith into conſtant good Silver, but into very good Gold. Whoſoever is ſeized with a deſire of ſuccouring the miſery of the ſick, he will do better for publick good, in uſing ſuch a fixed *Mercury* rather for expelling the Cruelty of a Tyrannical Gout, and the French Diſeaſe, than for Gold making, unleſs ſo far as he hath need to uſe the ſame for neceſſary Aliments.

Whoſoever deſires to know more of this Coralline *Mercury*, or (according to *Helmont*) Horizontal Gold; let him peruſe our little Treatiſe intituled the Seventh Part of the Spagyrical Pharmacopœa, where he may find not onely many *Mercurys*, which are not inferiour to this, but in many things excel it. Alſo there you are taught how a burning Spirit may be diſtilled from all Vegetables, and with ſuch a Spirit, by kindling and burning it, the *Mercury* of Wine be ſeparated from the Sulphur in flame, and that as a pure Cœleſtial Salt be gathered in a fit Recipient, and adminiſtred againſt all Diſeaſes, as a ſupream Univerſal Medicine. Alſo there is taught the way of purifying *Mercury*, and depriving the ſame of every loathſome Taſte and Odour, in ſuch wiſe, as it is rendred ſweet and pleaſant, like to Fire conſuming Diſeaſes, and for correcting every Cachexy of the whole Body. In like manner the ſame teacheth the way of preparing *Mercury* ſo, as it offers it ſelf to be ripened by the Secret Fire of *Atrephius* into the higheſt Medicine, and that in a ſhort time with little labour and charge.

Hitherto I have variouſly treated of the manifold Uſe of our Alcaheſt; but ſince this kind of Doctrine may profit Junior Phyſicians, Apothecaries, Chymiſts, and other learned men more than Mechanick Artificers; I purpoſe here to ſubjoin ſome other Secrets alſo, which may be of uſe to the People, that ſo our *Alcaheſt* may become *Oneſimus* the common Servant of many, and in this manner be verified what in the ſuperior or precedent Treatiſe is mentioned, *viz.* that of deſpicable Urine all men of all Orders, when they will may reap profit, and ſufficient Aliments. But, although Spirit of Urine alone, without the help of Oil of Vitriol, or ſome other Acid Spirit, cannot effect all that is to be performed, yet the labour of making Oil of Viriol is not to be eſchewed, ſince it is that which may be prepared in abundance with little charge, and almoſt no trouble. If any one be but a little more skilfull, than a common Chymiſt, then indeed he may prepare at leaſt four pound for the charge of one Imperial. If you cannot perform this work, Oil of Sulphur offers it ſelf, which is more conducible for preparation of the Liquor *Alcaheſt*, than Oil of Vitriol, and in a peculiar Furnace, of an hundred pounds of Sulphur, without any great trouble, you may eaſily prepare ten or twelve pounds of Oil, and that for a ſmall charge.

Wherefore, whoſoever would by the benefit of the *Alcaheſt* elaborate any thing to profit, he muſt firſt be provided of, and furniſhed with Spirit of Urine, and that ſome quantity, and alſo not a little Oil of Vitriol

Vitriol or Sulphur, ready for future uſe, that without any delay or hindrance he may happily proceed in his work begun, which without theſe he cannot abſolve. If Spirit of Urine and Oil of Vitriol be to be bought by any one, his *Alcaheſt* will be too dear, of it to prepare much to profit, as by the following ſhall appear.

What is that which *Pontanus* ſaith to this? The whole body of Mercury, without any previous Separation of the pure from the impure, may by the help of the Secret Fire of *Artephius* be totally ripened into a fixed Medicine or Tincture, without any diminution of its weight. Touching which wonderfull fixation, I in my Sick-bed made a ſmall trial, inſomuch as now I am obliged to believe what *Pontanus* affirmed touching ſuch a Secret Fire; openly confeſſing, that the ſame Secret Fire is more to be eſteemed in Medicine and Alchymy, than all other great Secrets, which have ever been obſerved by Philoſophers. Wherefore now, nothing grieves me ſo much, as that by reaſon of my great indiſpoſedneſs, being always conſtrained to keep my Bed, I am able to make no further trial of the ſame.

This Fire converts all venomous Subjects into ſalutiferous Medicaments; fixeth all things that are volatile; renders all ſharp and bitter things ſweet and pleaſant. In a word, this Secret Fire cannot more properly be compared to any thing, than to *Titan* or the *Sun*, whence all things draw their Life and Increaſe. For that Fire, firſt of Earth, Water and Air, produceth groſs, bitter and harſh Fruits, then ripens them being unripe, and changeth them into ſweet and pleaſant Fruits, imitating the *Sun* producing ſower Grapes, which it ſweetens after its various Operations upon them. The ſame may be ſpoken of the maturation of vulgar *Mercury*, being ſuch as *per ſe* (whilſt it is as yet volatile) is to be eſteemed an immature and bitter Fruit: but as ſoon as by our Secret Fire its Bitterneſs and noxious Venome ſhall be taken away, and it becomes fixed and able to abide the Examen of Fire, it is no longer a bitter Venome, but paſſeth into a ſalutiferous Medicament. Hence the worthy *Lully* cried out; *If you dulcifie the bitter, you will have the whole Magiſtery.* Which Dulcification our Secret Fire is able to compleat as perfectly as the *Sun* of all acid and harſh products of Trees, makes ſweet, pleaſant and ſalubrious Fruits. *Pontanus* witneſſeth, that he had laboured in the true matter of the Stone, yet that he erred more than an hundred times, and that he ſhould never have returned into the Royal way of Infallible Operation, if he had not read *Artephius*, and of him learned the Fire of the Wiſe. This indeed is a thing to be admired, that almoſt no Chymiſt imploys his Care, Study, Meditation and Counſel to ſeek out and find our Secret Fire, although to it there is ſcarcely given another like and ſecond in all the things of Nature. *Artephius* did ſo clearly deſcribe that Fire, as you would wonder that ſo few Searchers have ever comprehended his Mind. All other Philoſophers, who were partakers of ſuch a Fire, do with *Artephius* expreſly write, that it burns continually in their Glaſs, and not ſo extrinſecally, in one degree. Whence indeed it is ſufficiently manifeſt, that the ſame is not common Fire made of Wood and Coals. Therefore I do poſitively ſay, that our Secret Fire, in a ſhort time, is able to tranſmute the whole of *Mercury* into a red, ſweet and pleaſant Tincture, and alſo to change both humane and metallick Bodies.

Yet further, Touching the moſt fruitfull Uſe of our Alcaheſt, *bringing great Gain in Metallick Labours.*

AS we have heard that volatile common *Mercury* is fixed and rendred conſtant in Fire, by the help of our *Alcaheſt*; ſo it alſo in ſuch wiſe fixeth other Minerals, and volatile Metals, as the ſame in Cupellating, leave behind both *Sol* and *Lune*, not without notable utility. But thence eſpecially may you reap vaſt profit, if volatile *Sol* and *Luna*, extracted by *Aqua Fortis* out of Sand and Earth, be again totally fixed by help of that, in ſuch a manner, as they in Fire fly not; but yielding, permit themſelves to be melted as any other *Sol* and *Lune*. Metals, whenſoever wrought upon by the help of *Aqua Fortis*, although they were fixt before, degenerate into another Nature, and are volatilized, ſo as with a ſtrong Fire of Fuſion they fly away to the Owners great loſs. As for Example: If you diſſolve *Lune* in *Aqua Regia*, and upon the ſame Solution pour common Salt-water, the *Lune* will be precipited from the Water in the form of a white Powder, which if with other Water you well edulcorate and dry, you will have a Calx of *Lune* much more ponderous than the *Lune* was before Which kind of increaſe ariſeth onely from the ſharp Spirits of the Salt, which the Silver hath drawn into it ſelf ſo firmly, as by the benefit of Water they could not be totally ſeparated, but remain in it, not onely whilſt it is heated red-hot, but alſo in a ſtrong Fire of Fuſion, inſomuch as the *Lune* ſhews it ſelf not tractable in Fire, as any other Silver, but remains like a Stone in that vehement Fire, ſo as whilſt it is flowing, thoſe Spirits of the Salt carry away much of the Silver with them in fume; and part of it alſo penetrates into the Crucible. Wherefore ſuch *Lune* precipitated with Salt, cannot be melted again and made ductile Silver without great loſs and detriment, but appears intractable like a tranſparent Horn, whence alſo it is by Chymiſts called the *Horn of the Moon*; but I in my Writings name this Silver (as being that which is altogether volatile and fuſible) the *Mercury* of *Luna*.

In the ſame manner alſo *Saturn* may be converted into a Liquable and volatile *Mercury*, touching the admirable and profitable uſe of which, I have writ, but not publiſhed, a whole Treatiſe, which is intituled, *The Work of Saturn*: but of this no more here. The Evening of the Day now approaching, admoniſheth us to return to ſpeak of our volatile *Lune*, and to ſhew the way of reducing that into fixed and ſoft or tractable Silver; which indeed by unskilfull Men is ſuppoſed to be a difficult Art, but by skilfull Men it is known to be eaſily effected with the great Utility of the Operator.

But ſome one may ſay, what need we about that imploy our principal Cares and Meditations, to render ſuch precipitated volatile *Lune* into fixed and good Silver, ſince there are other ways of precipitating Silver from *Aqua Fortis*, viz. by the help of thin plates of *Venus*? To ſuch a Man, I thus anſwer: They who commonly ſeparate *Sol* from *Luna*, are in a great meaſure abuſed by that way of precipitation with *Venus* Plates; but they would never uſe that chargeable Precipitation, if they enjoyed the knowledge of any other more profitable. Chargeable, I ſay, is ſuch a Precipitation to thoſe that uſe it, becauſe much Water muſt be poured into the Solution, for waſhing away or weakening the force of the *Aqua Fortis*, that the *Lune* may the more

readily be precipitated by the *Venus*, and the *Aqua Fortis* alſo not diſſolve too much of the *Venus*. By this ſeparation the *Aqua Fortis* is loſt, becauſe it becomes Coppery, und unfit for a new uſe of ſeparating. For one Mark of Silver coſts in *Aqua Fortis* onely (not reckoning Labour and Workmanſhip) almoſt half an Imperial: wherefore our *Belgian* Refiners think it worth their while, if for ſeparation of every Mark of Guilt Silver, they ſpend but two *Holland* Florens, or $\frac{4}{5}$ of one Imperial, for otherwiſe they cannot gain much: Yet ſome of them will not precipitate their *Lune* with the help of *Venus* Plates, and ſo loſe their *Aqua Fortis*, but by diſtillation abſtract the *Aqua Fortis*, and afterward uſe it again. But this abſtraction is difficultly performed, and is not void of danger. For the Glaſs breaking, the Silver is ſpilt amongſt the Sand, ſo as the whole cannot be recovered again without ſome damage, and ſometimes there is great loſs. Wherefore ſuch a way of ſeparating, although you can ſave part of the *Aqua Fortis*, yet it is chargeable and alſo dangerous (when *Aqua Fortis* is to be prepared in a great quantity, as is wont to be done in metallick Mines of Gold and Silver, and alſo in Goldſmiths Shops) becauſe it requires a filthy toil, ſordid labour, great expence, and a continual tireſome and perillous trouble. I add perillous, and that deſervedly; becauſe thoſe Operators, who frequently ſeparate with *Aqua Fortis*, do very often become *Peripneumonick*, and diſeaſed in their Lungs, by attracting with their breath the Acrimony of thoſe Spirits into their Lungs, with which ſharp Spirits the Lungs being touched, are hurt, and rendred obnoxious to Putrefaction, inſomuch as among thoſe Separators you ſhall very rarely ever find an old Gray-hair'd Maſter. For ſuch Companions, even in their flouriſhing Age, are untimely hurried out of this life. But what are theſe feeble wretches able to doe, in withſtanding the great Power of Deſtiny? Of Golden-Silver, Moniers know not how to make Money before they have ſeparated the Gold from it, how great coſt ſoever they be at for ſeparating the ſame. About two years ſince I writ touching a certain Artificial method of ſeparating Gold from Silver in abundance; but becauſe I was taken ſick a little after, and have continued diſcompoſed almoſt ever ſince, I could not bring that laudable and moſt profitable Work of Separation to effect.

But afterward this my Infirmity continuing long, and I neceſſitated to keep my Bed, although troubled with no conſiderable ſenſe of pain, could do nothing, but onely bend and incline my ſerious thoughts and meditations upon Nature and Art; then God and Fortune ſhewed me the way, by which every common *Mercury* may be fixed and rendred conſtant in Fire. Which ſudden fixation of volatile *Mercury*, the Deluder of all Alchymiſts, gave me farther occaſion of fixing other volatile Subjects alſo. But among others, I ordered trial and proof to be made of a volatile *Calx* of *Lune* precipitated with ſalt Water, that I might experimentally ſee, whether ſuch volatile Silver might not be ſo bound up, as to ſuffer it ſelf, like any other *Lune* to be melted without detriment or loſs; the effect of which Trial or Proof ſucceeded according to my expectation. That indeed is a great Reward of a great Invention, inſomuch as it ſupplies me with ſufficient matter of aſſerting with *Archimedes*, It is an Invention worth the Milk of an hundred Kine. For this Fixation of volatile Silver will afford a famous Fruit of Utility in Alchymy, and eſpecially in the Separation of Gold from Silver; becauſe ſuch a way the Separation of Gold from Silver may eaſily be made; *viz.* there being no need of the Solution of Silver by *Aqua Fortis*, but it is ſufficient if the Silver be onely granulated, and the *Sol* which is in it extracted by *Aqua Regia*; becauſe that being done, you will ſee all the Silver reſiding in the bottom. And although there ſhould be half an Ounce of Gold in every Mark of Silver, yet you will need no more *Aqua Regia*, than onely ſo much as is required for the Solution of ſuch a quantity of Gold; ſo as a diligent Man, in the ſpace of one day, may very well ſeparate an hundred Marks of Golden-Silver, for the charge of three Duckets. And this artifical method of Separating may not onely be uſed by the Separators of Gold from *Lune*, but you may thence alſo reap greater profit, whenſoever you are deſirous by the help of *Aqua Fortis* to extract Silver from Stones, Sand and Clay, and to precipitate the ſame with Salt: for this way all the *Aqua Regis* will be ſaved, that *Aqua Fortis* by the addition of Salt being turned into *Aqua Regis*, which will be moſt powerfully conducent for extracting Gold out of Sand and Stones, and for precipitating by a Mercurial Precipitation of the Gold from the *Aqua Regia*, and afterward that *Aqua Regia* may again be uſed with notable profit for extracting like Gold. Touching which gainfull Extraction, the Seventh Part of the *Proſperity of our Country* largely treateth. Here my intent was onely to publiſh an Artificial, and not chargeable way of ſeparating Gold from Silver; which is ſuch a method, as I believe the World never knew before.

Thus this new-invented Work of Separation is a moſt profitable Compendium, by the benefit of which every skilfull Man hereafter may with a good courage labour, and increaſe his Goods and Fortunes honeſtly: for I believe there cannot be invented any new Work more compendious than this we have here alledged, for the ſeparation of Gold from Silver: wherefore we acquieſce in that. But if any one would be more prolixly inſtructed in this Artificial Separation, let him peruſe the above-recited Seventh Part of the *Proſperity of Germany*, where he may ſatisfie the hunger of his deſires. Here you have the *Firſt Appendix on the Seventh Part of my Spagyrical Pharmacopœa*: but in the following *Second Appendix* (God willing) I will diſcover yet greater Secrets, which may be perfected by our *Alcaheſt*, but were never yet manifeſted to the World. But at this time, courteous Reader, take in good part theſe few things here premiſed, and whatſoever excellent thing ſhall hereafter offer it ſelf, the ſame ſhall be preſented to thy Conſideration.

Therefore, ſince (as is above declared and ſhewed) our Secret *Alcaheſt* is able to enrich Mortals with many kinds of gainfull Emolument, he is in no-wiſe to be reprehended, that aſpires to the knowledge of elaborating ſo excellent a Work, *viz.* how he ſhould prepare for himſelf Oil of Vitriol or Sulphur, and that in abundance for a very ſmall charge: for nothing hinders, but that four or five pounds thereof may be prepared for the charge of one Imperial. I need not mention how Spirit of Urine may eaſily be had and prepared in abundance, *viz.* ſo ſoon as one ſhall cauſe Urine mixt with Quicklime to aſcend in a large diſtillatory *Veſica*. For if any one ſhall ſo prepare his *Alcaheſt*, eight or ten pounds thereof,

thereof, after his work is done, will ſcarcely coſt him one Imperial: wherefore he muſt needs gain much more, than if he ſhould buy the ſame of others that ſell it, for a great Price. In the mean while I doubt not, but that ſuch a moſt eaſie Coagulation or Fixation of *Mercury*, as is made by help of this *Alcaheſt*, will excite not a few of the more unskilfull Readers, to the love of Learning from expert Artiſts, the Art of preparing the *Alcaheſt* in abundance.

A Recapitulation,

OR

More ample Declaration of the precedent Secrets revealed.

Well meaning Reader,

HEre in this Appendix I do indeed treat of very few Secrets, but thoſe are very great, (which may be acquired by our Alcaheſt,*) the like of which no other Man before me did ever impart to the World. Now contemplate, and well conſider with thy ſelf this ſwift and not chargeable Fixation of* Mercury, *which ſo many famous and induſtrious Searchers have laboriouſly ſought for many hundreds of Years now paſſed, as is known to the whole World. But the greateſt part of them have ſought in vain, and with a fruitleſs and unlucky endeavour miſerably loſt all their Patrimony and Fortunes, and become the Laughing-ſtock of other more happy Perſons, being themſelves Vagabonds, which caſt an aſperſion of Ignominy on the noble Art of Chymiſtry, and have rendred the ſame ſo odious every-where among the common ſort, as no good Man (although he hath by moſt diligent ſearch obtained ſome famous Medicine) dares to profeſs himſelf the Poſſeſſor of any Eminent* Arcanum *in Chymiſtry, leſt he ſhould give any occaſion to* Ariſtarchical *Cenſurers of defaming him, and calling him a* Gold making Animal. *Aſſuredly it is very manifeſt, that in all Regions of* Europe, *and in every Age, have lived ſuch Men moſt experienced, as have not onely tranſmuted* Mercury, *but other vile Metals alſo into good Gold, ſuſtaining every Examen of Fire. But this was done very ſecretly, leſt the Artiſts themſelves ſhould fall into the hands of Tyrants.* Paracelſus, *that moſt famous Monarch of all Philoſophers, Phyſicians and Chymiſts, did indeed openly write of the Fixation of* Mercury, *but in a Character ſo abſtruſe, as in all my life I never ſaw one Man who could fix his* Coralline Mercury, *or preſent it to the ſight of ſufficient and certain Witneſſes, except* Helmont *writing, that he could prepare ſuch* Mercury, *as in Medicine would perform all whatſoever the Phyſician ſhould have need of. But that the ſame* Mercury (*as* Paracelſus *teſtifies of it from his own Experience*) *enters into Gold and augments that, and exhilerates many impoveriſhed* Alchymiſts, *reſtoring them to a more fortunate ſtate; touching theſe Effects of the ſame, the worthy* Helmont *made no mention; yet he writ, that he did himſelf fix* Mercury, *by one onely abſtraction of his* Alcaheſt, *in ſuch wiſe, as of one pound he had left in the* Cupella *ſeven ounces of good Silver, which indeed is a famous Work in Chymiſtry, and worth while; but Gold is better. Truly I muſt needs confeſs, that I have often tediouſly laboured to no purpoſe in this Work, and never could with any profit extract good* Lune *thence, onely I always had a little good Silver. Nevertheleſs afterward, when I lay Bed-rid, and by reaſon of my four years ſickneſs, had conſumed all my Goods gotten by Medicine, it pleaſed the moſt wiſe God to confer on me ſo great a Light, as by the Splendor of that I found the Royal way of operating rightly; and now I am able in a very few days to fix any common* Mercury *into a fixed red Powder, which fixed* Mercury *will undoubtedly perform Wonders in Medicine. For* Paracelſus *writes, that the dolorous Gout may be radically expelled by the benefit of the ſame.* Helmont *ſubſcribes, that the ſame will perform all a Phyſician can deſire and wiſh for. Wherefore, if the ſame be of ſo great efficacy (for I doubt not the truth of his Aſſertion) no Phyſician hath need of any other thing than this; becauſe in what part ſoever of the World he reſides, it will ſupply him with Aliments ſufficient, and he will have no need to expoſe himſelf to the ignoble ſervitude and arbitrement of another, as the greateſt part of other Mercenary Phyſicians are wont to proſtitute themſelves for hire. For by this* Mercury *onely he may acquire to himſelf Honour and Wealth enough, although he otherwiſe perform no great matter in Chymiſtry. In all Nations are found Men afflicted with grievous Diſeaſes: of which no doubt is to be made, as a little after we ſhall hear. Wherefore it ſhould be the onely care, ſtudy and endeavour of an honeſt and candid Phyſician to obtain ſuch a fixed* Mercury, *in the mean while omitting all needleſs and vain Operations, together with all fruitleſs Diſputes, without any Foundation, touching other unprofitable Remedies. Whenſoever this is, there will be no need of* Galenical Medicines, *nor of the vain Pomp of ſo many withered, unprofitable and inefficacious Herbs, or ſo many painted Boxes, Pots and Glaſſes, with other frivolous*

frivolous Expences orderly placed in Apothecaries Shops.

Now let us hear what admirable Effects our fixed Mercury *is able to manifeſt in Metallicks.* Paracelſus *writes, that it exhilerates every* Alchymiſt *reduced to a poor Eſtate, and hath ingreſs into Gold, and augments the ſame. My own Experience of this I am willing to impart to the Candid Reader, as far as I have proceeded hitherto. Therefore let the well-meaning Reader know, that I found out this Art of Fixing* Mercury *no longer ſince than in* March *laſt of this Year* 1667, *and began to make proof thereof in the following Month of* April ; *and ſo ſoon as I had found the Truth of it, I thought good to publiſh ſo great an Invention to the whole World. Yet in ſo ſhort a ſpace of Time, I could not ſearch out all that was to be found, becauſe by reaſon of my diuturnal Illneſs I was conſtrained to keep in my Bed ; therefore I haſtned the publication of ſo excellent an Invention, becauſe I feared it would happen that the inſalubrious Air of* March *or* April *ſhould be my Death, and ſo all hope of divulging ſuch a Secret be totally fruſtrated. Whatſoever I found in the ſame within that ſmall ſpace of time, I have here communicated.*

I three ſeveral times perfected the Fixation of Mercury *in a ſmall quantity, and always found it every time higher and higher, and more and more beautifull. This fixed* Mercury *I cupellated with* Saturn, *but my* Mercury *remained fixed, without any Ingreſs made into the Lead, inſomuch as from it ſelf could give no Gold. Afterward I made another Trial, and then to my fixed* Mercury *I added a little common Gold, melting them into one Maſs, I found that this Gold from the* Mercury *had increaſed it ſelf more than half ; the remaindtr of my* Mercury *had made no Ingreſs, but remained lying like a Red fixed Calx. Which kind of proof fully ſatisfied my mind, becauſe the reſidue of my* Mercury, *which had not entred into the Gold, was not loſt, but converted into an excellent Medicine. If it pleaſe the moſt wiſe God to reſtore me to my priſtine health, as I hope he will in the next Summers heat, I ſhall not acquieſce in this proof onely, but further try whether I can of this* Mercury *yet make ſome further improvement. In the mean while I ſing Praiſes to the Immortal God for ſo noble a Medicine againſt the dolorous* Gout.

Thus, Reader, you have my Experience touching the Fixed Coralline Mercury. *If I find any other more excellent Experiment of this (as I doubt not but I ſhall) I will ere it be long make thee partaker thereof in a following* Second Appendix.

Whatſoever I have above preſcribed touching the Mercury *of Wine, as being an excellent Salt, and Supreme Medicine, I did ſufficiently explain, except the Inſtrument to be made for burning the Spirit of Wine, which is not yet ſufficiently expreſſed.*

But here it is to be obſerved, that a burning Spirit extracted from Corn or other Vegetables, in no-wiſe yields ſo much Mercury, *as Spirit of Wine doth, and eſpecially if diſtilled from rich Rheniſh Wine. In like manner alſo ſo much* Mercury *cannot be had from any ſweet* French *or* Spaniſh *Wine, as from Rheniſh Wine. So ſoon as by ſearch I found the reaſon of this difference, I could from any burning Spirit made of Corn, extract as much* Mercury *as from Rheniſh Wine , inſomuch as I now (praiſe and thanks be given to God) can eaſily be without Rheniſh Wine and any other. The ſupreme Giver of all good Gifts, from his inexhauſted Fountain of Grace, hath abundantly refreſhed me with good things ; let him yet inſtill more into me, that I may again diſtill the ſame into other of his needy and officious Servants, who with me endeavour to publiſh the Magnalia of God.* Amen.

But proceeding yet further, we will briefly ſpeak of the Secret Fire *of ancient Philoſophers, being that by which they ripened their Tinctures. Therefore, for a Concluſion, let the Lover of divine and natural Wiſedom know, that ſuch a Fire is not made of Wood or Coals, but is a Firey-water, ſuch as gives forth from it ſelf neither ſmoak nor flame. The ſame is not hindred or excited by external Fire, but in the Glaſs, (about the Subject you intend to fix and dulcifie) it always burns in an equal degree, and converts the immature and harſh into ſweet and pleaſant, fixed and mature ; and alſo converts bitter Venome into ſalutary Medicine and Treacle.*

Therefore, whomſoever God illuminates with ſo great Light, as to know ſuch a Secret Fire, *he will no more need to ſeek or deſire any thing in Philoſophy and Hermetick Medicine, but will offer up inceſſant Praiſes to God, as to the Fountain of all Good , becauſe he will continually be mindfull of helping the Diſtreſſes of the Poor, and largely beſtow on thoſe Indigent Perſons, out of the abundance to him accruing by the benefit of that moſt noble Gift granted to himſelf.*

To the Supreme GOD alone be Praiſe and Glory for ever.

The End of the First Appendix.

THE

THE SECOND APPENDIX TO THE SEVENTH PART OF THE Spagyrical Pharmacopœa.

Wherein is treated of the further uſe of our ſecret *Sal-Armoniack*, for the meliorating of the meaner Metals, and more particularly of the profitable extracting or ſeparating *Sol* and *Lune* from *Jupiter*. With a ſubjoyned information how by means of the Mercurial Water of *Jupiter*, Tinctures may be extracted in quantity not onely from *Sol*, but alſo from *Mars* and *Venus*, and all precious, as well as common Stones; and that (as it were) in a moment, without Fire or any conſiderable charge.

Faithfully Tranſlated out of the High-Dutch.

Kind READER,

IN my foregoing firſt Appendix of my Pharmacopœa Spagyrica, *I promiſed a ſecond concerning the further uſe of our ſecret* Sal-Armoniack, *that the ignorant as well as doubtfull might be fully ſatisfied of the truth. The reaſon why I rather chooſe to add two Appendixes to the ſaid ſeventh Part, than to publiſh the ſecrets therein contained, under the title of the eighth Part, is becauſe I have reſolved not to go beyond the number 7 (in which ſomething extraordinary lies hid) in any of my Writings. And foraſmuch as I have already publiſhed ſix Parts* of the welfare of my own Countrey; *I intend ſhortly to add the ſeventh Part, which ſhall contain clear and full inſtructions, without concealing the leaſt circumſtance or manual operation how every one who is but a little skill'd in Fire, may with great profit extract from Sand and Stones,* Sol *and* Lune, *and thereby get a plentifull livelyhood in any part of the World. I have alſo at preſent in hand, the two laſt Parts of my Treatiſe of* Furnaces, *five of them being already in Print, that I may in that Piece alſo compleat the number ſeven: which two laſt Furnaces are extraordinary uſefull; for in treating of the ſixth Furnace I deſcribe that Artificial Refrigeratory Inſtrument or Alembick, whereby the* Mercury *or Cæleſtial* Niter *of all Vegetables, Animals and Minerals is caught by kindling Spirit of Wine upon them, by which means the ſaid* Mercury *is ſeparated from its groſs Body, and unprofitable part, and becomes highly exalted and purified. Which inſtrument the Philoſophers have always carefully concealed. The ſeventh Part of my Furnaces ſhall contain the deſcription of a little Furnace in which with a very inconſiderable quantity of Coals and in a few hours, diſtillation may be performed by Retort, being ſuch a* Compendium *as has never yet been publiſhed to the World. In which Furnace alſo the Tinctures of Metals may with the ſecret Fire of* Artephius, *or by the proper Agent of the matter of the Stone, in a ſhort time be fixed and maturated. And if it ſhall pleaſe God to continue my Life a while longer, I intend to carry on theſe my following Works,* viz. The Mineral Work, the wonder of the World, *my* Centuries, *with other of my Writings, to the ſeventh number; but before I publiſh theſe I intend to Print ſome other Treatiſes,* viz. Of the ſecond Terreſtrial, and third Cæleſtial Purgatory, *and another* concerning God and good and evil Spirits.

Now as to the ſecond Appendix, I intend therein briefly, but fundamentally to declare the true gainfull particular as well as univerſal tranſmutation of Metals; yet not ſo, as that every lazy proud Lubber may become Maſter of theſe ſecrets, and thereby ſtrengthen himſelf in his Pride and Debauchery, by no means: but they ſhall be ſo laid down, that thoſe who have attained to ſome skill of managing Fire, may eaſily comprehend the ſame; yea the whole World will, I hope, have cauſe to rejoyce for this my faithfull Communication. And in caſe there be any that might not find clear and full ſatisfaction in this my Appendix they may read my other Writings, particularly thoſe yet to be publiſhed, wherein they will meet with a further Elucidation of theſe ſecrets.

And as for thoſe my good old Friends who never baſely complied with the Enemies of Art and Truth, to them I am (as I always was) ready to communicate a ſhorter and neaȩer way than it is fitting here to expoſe to every Man.

Of the further profitable uſe of our ſecret Sal-Armoniack *for the Melioration of Metals.*

IN the ſeventh part of my *Pharmacopœa Spagyrica*, I have at large declared how our ſecret *Sal-Armoniack* is to be made together with the uſe of it in the preparation of many excellent Medicines, hitherto unknown. And becauſe therein I did not diſcover all, I added to it an Appendix, treating concerning the uſe of the ſaid *Sal-Armoniack* and other profitable ſecrets. But foraſmuch as the virtues of the ſaid *Sal-Armoniack* are great and unfathomable, I have thought good to add the ſecond Appendix, which ſpeaks of its uſe in meliorating the meaner metals. I intend therefore in this writing to diſcover great things, neither ſhall the Worlds ingratitude deter me from ſo doing. I ſhall begin with *Saturn* and *Jupiter*, and afterwards treat of the melioration of other meaner metals, *viz. Mars* and *Venus*, how by Art their corruptible and combuſtible *Sulphur* may be ſeparated from them, and their purer part, (*viz. Sol* and *Lune* which are hid in them) extracted and made viſible.

Lead and Tin, to outward aſpect do much reſemble one another, ſave onely that *Jupiter* is whiter, for which reaſon the Philoſophers have called it white Lead, *Antimony* black Lead, and *Biſmuth* gray Lead; becauſe all of them like Lead, eaſily melt in the Fire.

Concerning *Saturn* and *Jupiter* (being the higheſt Planets in the Firmament) the Heathen Philoſophers have writ much in their Fables: as amongſt other things, that *Jupiter* drove his Father *Saturn* from his Kingdom, and made himſelf Maſter of it and other like Stories; in all which they obſcurely hinted to us the tranſmutation of Metals. For theſe Poetical Fables though they ſeem trifling and fooliſh to thoſe who have not attained to any conſiderable experience in Fire, ſo that of one thouſand Readers ſcarce one reaches the true ground of them, (though 'tis known they were writ by men of great learning and experience) yet they whoſe underſtanding God enlightens find in them an hidden Treaſure.

Now to the end I may not bury the Talent God has been pleaſed to beſtow upon me, but improve it for the good of the World, I ſhall here diſcover the melioration of *Jupiter* and *Saturn* to the glory of God the Author of all good, and for the uſe of all mankind, without reſpect of Perſons, whether they be Friends or Enemies: the good and virtuous will without doubt thankfully accept this my communication, and to the ungratefull and unworthy, this my well-meaning diſcovery of ſuch profitable ſecrets will but heap Coals on their Heads. Wherefore it ſhall not repent me though it ſhould come to the hands of my worſt Enemies, as being ſufficiently contented in this that I am any way inſtrumental in making known the wonders of God and nature to the World.

Thus in the name of God without envy or repining I proceed according to his command, to do good to Friends and Enemies, good and bad: if the wicked abuſe any of theſe ſecrets, God in his due time will meet with them, and pay them in their own Coin. Follows now the nature and property of *Jupiter* and *Saturn*, according as they have been diſcovered to me by Fire.

Of the nature and property of Lead.

Saturn is an immature Metal, made up of much groſs *Mercury* and little *Sulphur* which is impure. Its Salt much reſembles Salt-peter, which is the cauſe of its coldneſs and eaſie fuſibility. When its *Mercury* is purged from the impure *Sulphur*, it becomes like Gold in weight, and may by Art be reduced to the colour and fixedneſs of Gold. When its ſuperfluous combuſtible *Sulphur* and nitrous Salt from whence proceed its ready fluxibility, and piercing and devouring nature are ſeparated from it, all true Philoſophers witneſs that there the *Mercury* of Lead may be turned to Gold, for they call Lead their leprous Gold. Now as the Leproſie in Man proceeds from a cold moiſt and over Salt Conſtitution of Blood, which corroding the Skin and Fleſh produces ſuch an abominable Scab upon the Body, eſpecially in thoſe parts where moiſture moſt abounds, *viz.* about the Noſe, Ears, Eyes, *&c.* but where the whole maſs of the Blood is become corroſive, there it ſpreads over all the Body ſparing no part, but filling it with Sores and Ulcers; ſo as at length where no potent Remedies are uſed to mortifie this malign corroſive humour, it deſtroys the Body and Death follows. To cure which formidable Malady, the Ancients made choiſe of fixed Gold, as not being ſubject to any corruption, which wiſe intention of theirs is very prepoſterouſly imitated by our *Galeniſts*, who when they find that their helpleſs and unprofitable Medicaments want the deſired ſucceſs about their Patients, and that ſmall hope of ſaving them is left, betake themſelves to Gold, Silver and Precious Stones, for to help at this dead lift. But let ſuch as theſe remember that they will find it hard to anſwer theſe their proceedings one day, by which they onely poſt their patients out of the World: for what can the ſtomach of any man, but eſpecially of the weak and ſick do with the filings or leaves of Gold and Silver, or the Powder of Precious Stones? can we ſuppoſe that the Stomach can draw any virtue from thoſe things, that the moſt corroſive Waters will ſcarce touch? But this hath been ſo often inculcated by others, that it is matter of wonder, that ſuch fooliſh

and

and fruitleſs ingredients have not been long ſince exploded and laid ſide, being indeed nothing elſe but the ſhame and reproach of Phyſicians; and all that can be ſaid for them is, that they muſt be well paid for, and ſo help to make the Pot boil; without doubt when the promiſed *Elias Artiſta* ſhall come, he will put an end to all this unprofitable ſtuff, and inſtead therefore reſtore true powerfull Medicaments; to which good end I hope my *Purgatory of the Philoſophers*, with *the Sixth and Seventh Part of my Furnaces* will not a little contribute. Thus it ſeems Truth muſt yet for a while be deſpis'd and oppreſs'd, till God, the truth it ſelf, be pleaſed to raiſe up a mighty Hero to deliver it from Contempt, and Crown it with glory and honour.

It cannot be denied, but ſome experienc'd Philoſophers, as *Paracelſus* and others have declar'd, that with Gold and precious Stones wonders may be done in Phyſick, when firſt they be reduced to potability; but have always condemn'd the uſe of their compact and fixt Bodies, which are inſuperable by Fire it ſelf, and therefore much more by the gentle heat of the Stomach. And indeed if thoſe Phyſicians, who ignorantly make uſe of ſuch groſs and compact Bodies, did know the living Gold, Silver and precious Stones of the Philoſophers, and the due application of them to the ſick, they would by this means get more honour, and not be ſo injurious to their Neighbour, as they are, by exhibiting ſuch unprofitable and hurtfull things for Remedies.

I cannot but on this occaſion ſpeak a word of the Leproſie and its cure; which being confeſſedly a Saturnine diſeaſe, may eaſily be cured by Saturnine Medicaments, ſuch as are Black Lead, the *Antimony* of Wiſe men, or *Magneſia* of *Saturn*, being duely prepared. But to return to our Lead or Leprous Gold, and enquire how we may beſt rid him of his Melancholy Leproſie, and inſtead thereof reſtore to him a healthy ſanguine complexion, which can no way better be done than by evacuating his ſharp corroſive blood, or dulcifying of it. For, as has been ſaid, Lead contains a ſharp ſal-nitrous Spirit, which corrodes and devours all hard things, which the Ancients have intimated by their portraying him with a ſharp Sythe in one hand, and in the other holding a young Child, which he devours; wherefore alſo he is called a devourer of Infants, and a ravenous Wolf. Which ravenous property he expreſſes to the life, when on the Cupel he devours whatſoever is added to him, and therefore is called an unmercifull Father to his Children, becauſe he devours and deſtroys them. According to all Philoſophers and Aſtronomers he is the higheſt and firſt of all the Planets in the Firmament, upon which account the other Planets and Metals, *viz. Sol*, *Luna*, *Jupiter*, *Mars*, *Venus* and *Mercury* are call'd his Children, though improperly, for they are his Brethren, which he devours, ſwallows and deſtroys on the fiery Cupel, except *Sol* and *Luna*, which though he ſwallows as well as his other Brethren, yet can he not concoct or digeſt them, but is fain to vomit them up again, and they are ſo far from receiving any hurt in the Stomach of that ravenous Wolf, that they come forth much purer than before, leaving all their filth behind them. So that this devouring Glutton, notwithſtanding the corroſive acidity of his Stomach cannot conſume Gold or Silver, but robs them onely of their ſuperfluous Sulphur, which is the corrupter of the *Mercury* in Metals, of which *Paracelſus* excellently writes in his *Cælum Philoſophorum*, which I have quoted in my firſt Appendix concerning the uſe of the *Alcahеſt*.

Now that there is a great acidity in Lead, appears from this inſtance; becauſe when it is melted, it pierces the Crucible, and runs through; and therefore Cupels have been invented, made of Bone-aſhes, which he cannot eat through, but ſinks like water into them. Yet there are alſo Crucibles made of Coal-duſt and good Earth proportionably temper'd together, which can hold *Saturn* in Flux for a year together, without ever piercing them: of which more may be ſeen in my other Writings.

This then is the Nature and Property of *Saturn*; he contains much, but impure *Mercury*, and a ſharp corroſive Salt-peter Spirit; when he is rid of theſe, he affords good Gold and Silver, yet not alone and of himſelf, but with help of his Brother *Jupiter*, whoſe ſuperfluous Sulphur kindles the Nitrous Spirit in Lead, and conſumes it; ſo that by this enkindling, not onely the hurtfull Salt-peter in Lead, but alſo the ſuperfluous Sulphur in Tin are both conſumed and deſtroyed. This being done, if the Tin thus mixed with Lead be driven off on the Cupel, they will yield Gold and Silver enough for a competent livelihood.

If thou would'ſt be further aſſured that Lead contains a ſharp Salt-peter Spirit, which by no other way can be taken from him, than by his enemy Sulphur, by whoſe means it is kindled and conſumed, the following Experiment will give thee full ſatisfaction. Onely by the way note, that this conſuming of the Nitre in Lead, does very much alter its Nature, making it hard, and of difficult fuſion like Iron, ſo that great Guns may be made of it. Now the Experiment is this: Take of the filings of Lead three parts, of Brimſtone in Powder one part, put them into a Crucible, ſurrounded with Charcoal, ſo as it may heat leiſurely and by degrees; by this means the Brimſtone will penetrate the Lead, and mortifie its Nitrous Spirit, which is the cauſe of its eaſie fluxibility, and at the ſame time the Sulphur becomes mortified alſo, which before was more fluxible than the Lead, but now by its union with the Lead, is very hard to be fluxed. This mortification or induration of Lead, with common Brimſtone, affords no Melioration, and is onely here inſtanced, to demonſtrate there is a Salt-peter in Lead, and that Salt-peter and Lead, which both are ſo very fluxible, do harden and mortifie one another. But now when the Salt-peter that is in Lead is kindled and conſumed by the Sulphur that is in Tin, then one Metal meliorates the other, and the hurtfull ſuperfluity of both is deſtroyed, *viz.* the Nitre that is in Lead, and the Combuſtible Sulphur in Tin, from whence neceſſarily a melioration muſt enſue.

That Sulphur kills the Nitre in Lead, and makes it hard, thou mayſt yet be ſatisfied another way, *viz.* Take ſome ounces of Lead, melt them in a Crucible, and ever and anon caſt in a little piece of Brimſtone into it; continue this till thy Lead be become hard and influxible, by which means thou wilt be aſſured that there is Nitre in Lead. And that there is Sulphur in Tin, appears in that when it is joined with Lead, they kindle and conſume one another.

If thou deſireſt yet further to be confirmed, that there is Nitre in Lead, which makes it melt ſo readily, and fret through every thing; then do thus:

Take

Take Lead and melt him red-hot in a Crucible, and immediately he will pierce the Crucible and run out; take another Crucible and put Lead into it alſo, caſting, as ſoon as it is melted, ſmall bits of Brimſtone upon it, which will ſo mortifie the fretting Nitrous Spirit in Lead, that he will be no more able to pierce the Crucible, but will for a long time continue red-hot in the ſame.

If this demonſtration neither will ſatisfie thee, that the fretting nature of Lead proceeds from a ſharp Mineral Salt-peter Spirit, thou mayſt further prove it thus: Abſtract from two ounces of filings of Lead an ounce and an half of Oil of Vitriol or Spirit of Salt in a ſmall Retort, in which operation the dry Lead will draw to it the ſharp Saline Spirit, and that which comes over will be meer inſipid Phlegm, retaining nothing of its former corroſiveneſs. The diſtillation performed, take thy Lead out of the Retort, and try whether it be become more ſharp by the addition of the ſaid Corroſive Spirit, but thou wilt find that the Lead has taken in the ſharp Saline Spirit, coagulated it, and changed it into a ſweet Stone, in which no manner of corroſiveneſs can be taſted or perceived. Now if this be true, that Lead can turn ſuch a ſtrong corroſive Oil into a ſweet Stone, we need not wonder that he has a power to coagulate, hide, and make inviſible his own in born Saline Spirit. Concerning which matter thou mayſt read more in a ſmall Treatiſe of mine of the Principles of Metals, wherein ſpeaking of the Coagulation of Saline Spirits, I obſerve that Lead has the nature and property of Coagulating all ſharp and corroſive Saline Spirits. If this inſtance have not ſufficiently inſtructed thee, thou mayſt make another proof thus: Take the fore-mentioned Lead, acuated with Saline Spirits, and melt it in a tripple Crucible with a fire of Fuſion, let it be red-hot in Flux, and thou wilt find that in a moment it will run through thy three Crucibles, which common Lead would never do, from whence it is clear as the Sun that the piercing, fretting quality which is in Lead, proceeds from the Saline Spirits coagulated in or with it. Conſider well of how great uſe ſuch a Lead, whoſe natural devouring Faculty or Sythe is ſo highly acuated by Art, might be in the work of Tranſmutation, if we knew to make good uſe of it. The Philoſophers writing of *Saturn*'s ſharp Sythe, expreſs themſelves in theſe words, *Falx ejus mordax eſt, His Sythe is ſharp or biting:* which how it may be made much ſharper by Saline Spirits, has now been ſaid. A further enlargement might here be made concerning *Saturn*'s Sythe; but it ſhall ſuffice at preſent to have demonſtrated, that his eaſie fluxibility, and fretting devouring nature, proceeds onely from a ſharp Nitrous Spirit; which when Sulphur has conſumed and burnt away, much Gold and Silver may be ſeparated from him.

Of the Nature and Property of Jupiter, *what he wants, and what he hath too much of, and how his noxious ſuperfluities may be removed, ſo as on the Cupel he may yield his hidden Gold and Silver.*

TIN by the Heathen Philoſophers has been appropriated to the Heathen God (or rather Planet) *Jupiter*, who has the next place in the Firmament to *Saturn*; is by the Miners called White Lead, and like it melts with a ſmall heat, and eaſily unites with his Brother *Saturn*, continuing together in a moderate heat; but they no ſooner become red-hot, but their Brotherly love is changed to enmity, not being able to endure one another in a ſtrong fire, but each ſtriving to get looſe from the other, which yet cannot be without the loſs of one or both of their lives; ſo that this their combat may well be compared to the fighting of the Peaſants in *Lapland*, whoſe cuſtome is when two of them are highly incenſed againſt each other, to ſuffer themſelves to be tied faſt together, ſo as they cannot fly back or run away, and then fall to cutting and ſlaſhing one another ſo long with their knives, till the Death of one or both of them follows.

But to return from whence we have digreſſed. That *Saturn* and *Jupiter* are Brothers, the Heathen Hiſtory informs us, relating that the four Brothers, *Saturn*, *Jupiter*, *Neptune* and *Pluto*, their chief Gods, fell into diſcord amongſt themſelves which of them ſhould be the greateſt; which conteſt of theirs was at laſt by the mediation of the other Gods compoſed, they agreeing to divide the Empire of the World between them. And though *Saturn* were older than his Brother *Jupiter*, yet was he fain to content himſelf with the command of the Earth, whilſt *Jupiter* took upon him that of Heaven, *Neptune* that of the Sea, and *Pluto* the Dominion of Hell. Which Diviſion will not at all ſeem ſtrange to thoſe that underſtand Nature, who find that each Brothers lot was very correſpondent and comporting with their nature. The Nature of *Saturn* much reſembles the Earth, and he makes all things that he takes to him like the Earth; as appears from the fore-mentioned conteſt with his Brother *Jupiter*. But *Jupiter*, becauſe inwardly he is very ſulphureous and fiery, therefore is the Government of the fiery Heaven properly deputed to him, leaving *Saturn* to dig and moil in the Earth: Wherefore alſo the Ancients have repreſented him with a Spade in his hand, thereby intimating his Property of digging through or piercing all things: whereas they figured *Jupiter* with Thunder-bolts, and fiery Lightning-flaſhes in his hand, whence came that Proverb, *Procul à Jove, procul à Fulmine*; *Far from* Jupiter, *far from his Thunder-bolts.*

Now that Tin contains much Sulphur, may be thus experimented: Take the filings of Tin and powder'd Nitre, mix and put them into a Crucible over the fire, and they will kindle and conſume one another, ſo as nothing will be left in the Crucible. Or it may be tried thus: Melt ſome Tin in a Cruce, and when 'tis red-hot, caſt in ſome Nitre upon it, which kindles the Tin, the flame carrying part of it away, and the reſt is burnt to droſs or fæces. But not to inſiſt on this, it being very notorious that the greateſt part of Tin is nothing elſe but combuſtible Sulphur, the remaining part being a ſolar pure Mercury: ſo that when this Sulphur is by art wholly ſeparated from its pure Mercury, the ſame is eaſily ripened to Gold, by being joined with cold *Saturn*, which the following Praxis will abundantly make out.

'Tis worth our noting here, that this Sulphur of Tin doth not burn away, when the Tin without any addition is put to the fire, but doth then in the heat ſeize and lay hold of its own Mercury, burning and reducing the ſame to Aſhes, which are very hardly to be reduced to a Metal without ſome addition: neither will Lead join with theſe Aſhes, but thruſts them out from him, turning them to a white Glaſs; which is the reaſon why ſo few are found, who with profit can ſeparate the Gold and Silver which is in it.

it. *Paracelſus* in his *Cœlum Philoſophorum* ſaith expreſly that much Gold and Silver lies hid in Tin. We read alſo of others that have had the Art of it, and have thence extracted great treaſures of Gold and Silver; amongſt others *Bruſchius* in his Deſcription of *Fichtelberg*, gives us the Hiſtory of a Citizen of *Eger*, on the Borders of *Bohemia*, ſome few miles diſtant from the City *Nurnberg*, who had the skill of ſeparating the *Sol* and *Lune* which is in Tin to great advantage, having been enabled thereby not onely to build an Hoſpital and Church in the ſaid place, but alſo richly to endow the ſame for the maintenance of twelve old Men and three Prieſts in the ſaid Hoſpital. This Perſon, whoſe name was *Sigiſmund Wan*, ſuffer'd this Art to die with him, but withall left a Propheſie behind him that the ſaid Art 200 years after ſhould riſe again, and be made known to the World. Which Propheſie though *Bruſchius* in his foreſaid deſcription make no mention of, yet is undoubtedly true: and there is a Book in Manuſcipt, which is very common amongſt the Miners and other Artificers belonging to the ſaid *Fichtelberg*, which I have ſeen, and read in it the ſaid Propheſie, though at that time being young and unexperienc'd in the nature of Tin, I little minded it. But ſince God has been pleaſed in this my far advanced old Age, without any thing of my ſeeking, out of his meer grace and mercy to reveal the ſaid Art unto me, it hath given me occaſion to call to mind what formerly I had read, and put me upon reading the ſaid Book over again, where I found that his Propheſie was exactly fulfilled, for this *Sigiſmund Wan* died in the year 1467, from whence to this preſent year 1667, are juſt 200 years. This Propheſie being thus preciſely accompliſhed, I thought fit to ſet down ſome part, of the ſaid *Bruſchius* his Relation, from whence it appears that God doth often impart ſuch skill and knowledge to good and honeſt People, whereby they are enabled not onely to ſupply themſelves, but alſo to make liberal Proviſion for the Poor. The words of *Bruſchius* are theſe, *Wohnſiedel* has no extraordinary Buildings, beſides a ſtately and richly endowed Hoſpital, which was built in the year 1467, by a Citizen of the place named *Sigiſmund Wan*, though at the time of his building the ſaid Hoſpital, he was a Citizen of *Eger*. He had to Wife a *Venetian* Woman called *Barbara*, who had great skill in Alchymy, and in particular the Art of ſeparating Gold and Silver from Tin, by which means he became very rich, and having no Children, built the ſaid Hoſpital, conſtituting the Magiſtrates of *Eger* Guardians of the ſame, left them a great Summ of Money, with the Intereſt of which they maintain twelve old Men, and three Prieſts. Near the ſaid Hoſpital, is a very fair Church built by the ſaid *Sigiſmund*, where to this day a Picture is to be ſeen, containing the Pourctratures of the Founder and Foundreſs of the Church and Hoſpital, with the time and hour of their Deaths. This *Sigiſmund* lived at *Eger* the latter part of his life; and wrought his gainfull Work in the ſame Houſe, wherein at preſent dwells *Andrew Griffen*.

Thus far *Bruſchius*, from whoſe Relation it appears that there have been thoſe who from the meaner Metals, and particularly Tin, have been able to ſeparate Gold and Silver with great gain, ſo as to procure great riches thereby. We find alſo that in thoſe times charity was more exerciſed than at preſent, when men inſtead of building Hoſpitals, are rather ready to convert them, with their Revenues to their own uſe. For which wickedneſs of this Age, God ſeems to withdraw his bleſſing from the Earth, ſo that Mines do not ſo much abound, nor are ſo rich by far as formerly. How many places in *Germany* have we known bleſt with Gold and Silver Mines, as alſo with Lead and Tin Mines, containing much Gold and Silver, of which nothing is to be found now? And this ſame Tin Mine from whence *Sigiſmund Evan* extracted ſo much Gold and Silver, has now for near 200 years yielded no Oar at all. About the ſame time alſo there was a very rich Gold Mine, in an adjacent little City called Gold *Granach*; which is in like manner wholly exhauſted and loſt In the ſame Gold Mine, Antimony, alſo which is the Root of Gold, was found in that quantity, as from thence it was tranſported to all parts of *Europe*, but now very little of it is to be found there, and that which is found, contains no Gold at all, whereas that which was digged there before did abound with it. In like manner the *Hungarian* and *Tranſylvanian* Mines of Antimony ſo rich in Gold, which flouriſhed about 200 years ſince, are now quite ſpent ſo as no more Antimony is to be found there. Since which time the rich Silver Mines in *Jochems* that have been diſcoverd, which yielded an incredible quantity of Silver, but did not continue long ſo, God, for the ingratitude and wickedneſs of men ſuffering it to ſink away; of which many more inſtances might be given but theſe ſhall ſuffice.

But to return to our interrupted diſcourſe. 'Tis well known that all unripe Metals, when by the violence of Fire they are melted and ſeparated from their Oar, do ſend forth a poiſonous Arſenical Exhalation; yea even after they are wholly ſeparated from their Oar, they ceaſe not to exhale poiſonous fumes, though not comparable with thoſe they ſend forth when they are firſt melted from their Oar: as appears particularly in Tin, for if Wine be over night put into a new Tin Pot, it will give a Vomit the next morning. Copper alſo does the like; but Lead not ſo much, or rather nothing at all: whereas Iron gently purges downward, is wholſome and opens obſtructions; for Iron is onely endowed with a fix Sulphur, and contains no Arſenick, as Tin doth. Gold and Silver contain neither Sulphur nor Arſenick, and therefore the Wine that is put into them is not at all changed.

Seeing then that Tin has ſome Arſenick joyn'd with it, which cauſeth the foreſaid alteration in the Wine, whereas in Gold and Silver it is not changed at all, becauſe they are free from all fœtid cumbuſtible Sulphur and Arſenick; if we deſire to rid Tin of its poiſonous quality, and make it like Gold and Silver by removing its ſuperfluities, we muſt do it by Art. We ſee that *Mercury* of it ſelf is no Poyſon, but becomes ſo when ſublimb'd with Salts or otherwiſe joyn'd with them, by which means it becomes poiſonous and volatile. This is notorious, and all Chymiſts believe and acknowledge it, and we have as much reaſon to believe, that the ſame is the caſe of Arſenick and Cobalt, *viz.* that Arſenick would be no Poyſon of it ſelf, but by reaſon of ſome ſaline Spirit joyn'd with it in the Earth. We find alſo that Arſenick when it comes firſt out of the Earth of a grayiſh colour is nothing near ſo poiſonous, as it becomes afterwards by being ſublimed with Salts, for to make it white and tranſparent. For though Salts in themſelves be not poiſonous, yet when Minerals are in certain ways prepared with them they turn

them to Poiſons, for every volatile Mineral that is joyn'd with ſaline Spirits is poiſonous, but when the ſame Minerals are fixed, they loſe their poiſonous quality and become good Medicines, as may be ſeen in Arſenick, Cobalt, Orpiment and other poiſonous volatile Minerals, which being fixed, by running them down with Salt-peter, may ſafely be exhibited againſt ſeveral Diſeaſes. Which being ſo it will be eaſie to infer, that if we can fix the volatile Sulphur and Arſenick which is in Tin, we ſhall not onely take away its Poyſon and make it medicinal, but alſo make it like Gold and Silver.

Let this then be laid as a ſure foundation, that corroſive ſaline Spirits are the cauſes of all Poyſon, making fix matters to become volatile and poiſonous, and conſequently that volatile immature metals, as Lead and Tin, when their corroſive Spirits are mortified or driven away, become fixed. It is well known that the combuſtible noxious Sulphur of Metals, is the ſole cauſe of their imperfection, and that this combuſtible Sulphur has no greater enemy than Salt-peter, by which it is kill'd and deſtroyed, and yet no better Friend neither, which though at firſt ſight it may ſeem contradictorioy, yet is very true; for when the Niter does conſume the cumbuſtible Sulphur, it is indeed its enemy, but when by this Conſumption of the naughty Sulphur, the incombuſtible ſolar Sulphur of Tin becomes purged from its heterogeneous mixtures, we ſhall find that indeed Niter is the friend of Tin, as ſetting the ſolar Sulphur of Tin free from the captivity of its noxious Sulphur, ſo as now it can unite with Gold and Silver, and become ſuch it ſelf, which before was impoſſible. Thus we ſee that the conſuming and mortifying of the ſuperfluous Sulphur, is the life and deliverance of the incombuſtible Sulphur, and the corruption of the one, the regeneration of the other. To which purpoſe *Paracelſus* ſpeaks excellently, ſaying that *Corruption makes things perfectly good, for by means of it the evil that hides and abſconds the good, being taken away, the good manifeſts it ſelf*; Which is very true of Tin whoſe ſolar Sulphur being hid and held by its noxious Sulphur, the ſame muſt be taken away, before Gold and Silver can be extracted from it. Which ſeparation of the combuſtible from the incombuſtible Sulphur, muſt not be done with common Niter, which is too vehement for the nature of Tin, and would deſtroy the good with the bad, but a more mild and proper Salt-peter muſt be taken, *viz.* that which is hid in Lead, which is powerfull enough to kindle and conſume the ſuperfluous Sulphur of Tin, and ſet its ſolar Sulphur free, as will appear from the following Proceſs.

When therefore thou art minded to ſet upon this gainfull particular, and together univerſal Work, I would not have thee to be too covetous nor to begin with too great a quantity of Tin in hopes thereby to become rich of a ſudden; but adviſe thee to begin with onely two or three pound of Tin, and try whether the Art be true or no, and if true what gain may thence be expected. And if thou find'ſt it to anſwer thy expectations, thou mayſt then work in as great quantities as thou pleaſeſt, but if thou find'ſt that thou canſt not bring it to the deſired end, thou muſt be content to go to School a little longer, and learn to be more a maſter of Fire; or elſe leave it off altogether concluding thou art not predeſtinated to this Work. It is not enough to think thou canſt do it, thou muſt have the Art of it, elſe thy thinking will little avail thee. What I write here, is no other than the truth, of which the Reader may aſſure himſelf.

A Proceſs for to ſeparate Gold and Silver with great profit from Tin.

SET on a Cupel under a Muffel one, two, three pound more or leſs of Lead, let it be red hot, then caſt into it half an ounce, one ounce or an ounce an half of Tin, and you'l ſee the Tin mount above the Lead, and the Sulphur of the *Jupiter* will kindle the Salt-peter of the Lead, and turn to yellow Aſhes, which ſtill muſt be taken away with an Iron Inſtrument for that purpoſe, as long as any of the ſaid Aſhes, mount or appear on the ſurface of the Lead. When no more Aſhes appear, then caſt in a freſh quantity of Tin as before, turning the ſame to Aſhes till no more riſe. Continue ſo long with the incineration of freſh Tin, untill all the Lead and Tin be turned to Aſhes. Then mix theſe Aſhes with half as much of our ſecret *Sal-Armoniack*, and by Retort diſtill the *Sal-Armoniack* from it, which may ſerve again for the ſame Work. In this Diſtillation the *Sal-Armoniack*, draws to it the Sulphur of the Tin, and turns it to Fæces, and the pure part of the Lead and Tin are left in a *Regulus* at the bottom, which after Diſtillation may be beat from the *Scoriæ*: and becauſe the *Regulus* of Lead in this operation proves ſomewhat flat and platy, we may lay it croſs on an Anvil, and ſtrike it crooked with an Hammer, and ſo the *Scoria* will fall from it, which are carefully to be kept, as being of good uſe, which will appear hereafter. If we deſire to make a better ſeparation of the *Scoriæ* from the ſaid *Regulus* of Lead, we may put the ſaid *Regulus* with its Fæces into a Crucible, and having given it a Fire of Fuſion, pour out the *Regulus* into a Cone, and the *Scoriæ* will abide in the Cruce, as being of more difficult fuſion than the *Regulus*. This *Regulus* of Lead, muſt again be ſet upon the Cupel, and when red hot, we muſt put Tin to it as before, incinerate the ſame and gather the Aſhes, then mix them with *Sal-Armoniack*, diſtill and ſeparate the *Scoriæ* from the *Regulus* as before. This labour muſt be ſo oft repeated till all the Lead and Tin be turn'd to Aſhes, which will be in three or four times, after which onely a ſmall *Regulus* will be left, which we muſt refine on the Cupel like other Lead, and thus the Gold and Silver which was in the Tin, will be left on the Cupel, which muſt be granulated, and the Gold and Silver ſeparated from each other with *Aqua Fortis*.

The *Scoriæ* proceeding from this Work muſt not be deſpiſed, being more worth than the Gold and Silver which are left on the Cupel. This work being well performed, every pound of Tin will yield ſome Crowns in Gold and Silver, which richly pays both coſt and pains. And he that has the skill to prepare the ſaid *Sal-Armoniack* by a compendious way, may expect the greater profit from this Work. The *Sal-Armoniack* which comes over by Diſtillation, will ſerve for the ſame purpoſe again, nothing of it being diminiſhed, but what abides with the *Scoriæ*, which by making a Lye of the *Scoriæ* may alſo be ſaved, by which means a wonderfull Salt is obtained, which abounds with many and great virtues; concerning which we intend (God willing) to treat at large in our third Appendix, I had intended indeed to ſpeak of it here, but I find this Appendix

dix is grown too big under my hands; and therefore ſhall refer the ſuperlative great virtues of the ſaid wonderfull Salt to my Third Book. Yet to the end, that the Lover of Art in the mean time, till my Third Appendix be publiſhed, may not altogether be ignorant of what great things may be performed by it, I have thought good to inform him, that I have often in my other Writings made mention of this Secret *Sal-Armoniack*, yet concealing its preparation, *viz.* in my Book of *Dialogues*, ſpeaking of the Preparation of the Lion's Blood. In my Treatiſe of *Elias Artiſta* I have called this Salt, Salt of Art, as alſo the Biſhop aud High Prieſt of Metals, and there at large informed the Curious, how by means thereof they may inſeparably conjoin Gold and Silver. In other of my Writings I have given it other names. This wonderfull Salt of which I have treated in my Book of the Three Principles, ſhewing it to be that wherewith *Jupiter* changed himſelf into a golden ſhower, and got entrance through the Tiles into the ſtrong Tower where *Danae* was ſhut up, thus beguiling her, and begetting on her *Perſeus* the Deſtroyer of the Sea-Monſter, and Deliverer of the Beautifull *Andromeda*, whom he took to Wife; and afterward vanquiſhed the *Gorgones*, keepers of the Golden Apple bearing Orchard, *&c.*

This our Salt of Art is the Secret Chalybs of *Sendvogius*, wherewith he extracts the Tincture of Gold, and of it prepares the tinging Stone of the Philoſophers. This our Salt of Art is alſo that *Juno*, to whom (as *Virgil* relates) the Golden Bough broke off by *Proſerpina* from the Dark tree is conſecrated: of which I have elſewhere treated more at large. This Salt alſo is our *Proſerpina* the Goddeſs of Hell and Wife of *Pluto*, and is much more ready and handy in breaking off the ſaid Golden Bough, than that *Proſerpina* which by Diſtillation (with great toil and labour) breaks off her Golden Branches: for this our *Proſerpina* performs it without fire, or any trouble to ſpeak of, and offers it up to the Goddeſs *Juno*. Which ingenious and profitable Work I intend (God willing) to ſet down in my Third Appendix; wherein I ſhall communicate to the World a perpetual Minera of Gold and Silver, which every one without any great pains may in ſtillneſs work in his own houſe: For there is no eaſier way to extract the hidden Gold from all Metals in quantity and without fire, than by means of this our Goddeſs *Juno*, or Jovial *Proſerpina*.

Let the Reader who deſires to know further of theſe Poetical Fables, read the ingenious *Ovid*, and others who make it their buſineſs to treat of them: and in reading he will obſerve, that *Jupiter* is by them repreſented to be the God of Fire and Lightning, and *Juno* his Wife and Siſter the Goddeſs of the Air; whence we may gather, that by the word *Juno* is to be underſtood a ſpiritual volatile moiſture and watry *Jupiter*. Now the Artiſt who has *Juno* for his Friend and Advocate, may eaſily obtain from *Phœbus* great Treaſures, as well for the health of the Body, as of outward Riches; and this is ſo eaſie to be done, and with ſo little charges, that I dare not be ſo bold to write more of it, leſt the wicked and unworthy ſhould ſmell out the reſt.

Now foraſmuch as this Appendix is ſwoln to a bigger bulk than I had intended, I ſhall refer the melioration of Iron and Copper, by means of our Secret *Sal-Armoniack* to our Third Appendix. And ſhall onely ſay thus much at preſent, that theſe two deſpiſed Metals, do afford more profit, and with leſs charge and trouble than Lead and Tin; which Proceſs I intend to communicate in my next Appendix.

If any find the trouble and charges of Preparing our *Sal-Armoniack* too great, he may attempt the Work with common *Sal-Armoniack* ſublimed; and if that do not fully anſwer his deſire, he may afterward prepare ours, or get it of thoſe that make it in quantity. If it pleaſe God that I live over next Summer, I intend my ſelf to work this profitable Proceſs of extracting *Sol* from Tin; as alſo to extract the Tinctures of Copper and Iron with our *Alcaheſt*, in great quantity, and to give the over-plus of Profit to the Poor for a Memorial to the World. In the mean time I have here at large declared how the ſuperfluities of Lead and Tin are to be removed, in order to the ſeparating of the Gold and Silver contained in them; and this without concealing any of the Manual Operations thereto belonging: though I queſtion not but many who may attempt the ſame, will by miſtaking ſome Point or other fail of their end. Above all, great care muſt be had that the Tin be not mixed with Copper or *Regulus* of Antimony, which will make the Aſhes hard and irreducible; the *Sal-Armoniack* alſo muſt be well prepared, ſharp and penetrative, that it may work upon the Tin aſhes, and make them fluxible and reducible to Metal. Neither muſt the Tin-aſhes be ſuffer'd to lye too long on the Lead, but continually be taken away, for otherwiſe they will become hard and influxible. In a word, 'tis practiſe onely and experience can make a man Maſter of this Work, it being impoſſible to ſet down all particulars ſo clear and diſtinct, as that the unexperienced may not eaſily miſtake. In caſe therefore this my Appendix ſhould ſeem too dark to any one, let him have patience till my Third Appendix be publiſhed, in which I intend to communicate a much more eaſie Proceſs for extracting Gold and Silver out of Lead, Tin, Iron and Copper.

There is alſo a way of turning fine Tin alone by it ſelf into Aſhes, by ſtirring it continually in an Iron Pot over the fire, which Aſhes muſt be reduced with our *Sal-Armoniack*, and then turn'd to Aſhes again and reduced, which muſt be repeated till the greater part of the Tin be turned to *Scoriæ*, and the Gold and Silver melt down to a *Regulus*, which being teſted, leaves behind the Gold and Silver which was in the Tin, and the remaining *Scoriæ*, or Droſs, are of greater value than the Gold and Silver it ſelf. For he who knows to make uſe of theſe Fæces as a Magnet to attract the Gold from metalline Solutions, will get great profit thereby; the ſaid Fæces being a main cauſe of my publiſhing this Treatiſe, becauſe of their great and profitable uſe both in Phyſick and Alchymy; foraſmuch as with their help not onely Gold and Silver, but alſo true Univerſal Tinctures may be extracted from Stones and Metals: So that he who knows the uſe of theſe Jovial Fæces may not onely richly maintain themſelves, but alſo liberally communicate to the Poor. If God continue my life, I intend to undertake this profitable Work my ſelf, and thence make ſome proviſion for the Poor; for I have already taken my leave of this wicked World, expecting with patience an heavenly Guide to conduct me to life eternal, which I earneſtly pant after.

A Corol-

A Corollary, *or Supplement to the foregoing* Appendix.

WE have ſeen in the foregoing Treatiſe, how with the help of Lead, the Gold and Silver which is hid in Tin may be extracted with our Secret *Sal-Armoniack* ; which after it has ſeparated the ſaid Gold and Silver, doth ſtill retain great virtues, as being become a true natural Magnet, able without much trouble or fire, to extract not onely from Gold, but alſo from the groſs bodies of Iron and Copper their pureſt Tinctures, which in them are better, and in greater quantity than in Gold it ſelf. Which Solar Magnet few Philoſophers have known, or the uſe of it. Our *Coſmopolita* writes moſt clearly of the ſame in the following words: *There is a Steel which can extract from the Rays of the Sun, that which many have ſought and not found.* And again, *If our Steel copulate eleven times with Gold, the Gold thereby becomes weakned almoſt to death, and the Steel will conceive and bring forth a Son more famous than his Father. Nuyſement* alſo ſpeaks of this Magnet, but ſparingly and darkly, and *Paracelſus* yet more obſcurely. Others who had the knowledge of it, make no mention thereof at all ; fearing, 'tis like, leſt the Art might grow too common, and be proſtituted thereby : but without cauſe ; for though a Man be able to extract the Tinctures of Metals, yet hath he not therefore the whole Art: for though the ſaid Tinctures be of great uſe for the cure of all diſeaſes, yet can they not diſplay their virtues upon Metals, till they be fixed with Gold, and have obtained metallick ingreſs : but in Phyſick, as was now ſaid, they are very uſefull, before their fixation, and eſpecially thoſe which by our Magnet are extracted from *Mars* and *Venus*, for they purge all that is hurtfull out of the Body, not weakning as common Purges do, but ſtrengthening it. They alſo purge by Sweat and Urine, and ſtill all inward and outward Pains procure ſweet reſt, by reaſon of the Anodynous quality hid in *Mars* and *Venus*. So that theſe Tinctures of *Mars* and *Venus* before fixation may be uſed againſt all diſeaſes with aſſurance of good ſucceſs ; and when fixed, they turn Silver into Gold. For our Magnet robs the Dragon (*viz. Aqua Fortis*, wherein *Mars* and *Venus* are diſſolved) of the Golden Fleece he is keeper of, and, like another *Jaſon*, brings home the ſame, and with it reſtores his aged Father to youth again, and procures to himſelf vaſt and unmeaſurable Riches. For theſe Tinctures do great wonders in both faculties. It is not long ago ſince I took ſome grains (which I had left of a former preparation) of one of theſe Tinctures, to ſee if thereby I might be ſomewhat refreſhed, which indeed did perform all that could be expected from it, but having no more of it could not perfect my cure. Since which time I have had a great longing with the firſt occaſion to prepare ſome more of it, becauſe I found that upon taking that ſmall quantity, my bald head began to be cover'd with black curl'd hairs, from whence I am verily perſwaded, that had I had more of the like Tincture, it would have wholly renewed me ; and therefore ſhall not be wanting to make uſe of the firſt opportunity to prepare more of it, both for my own health and that of others, and publiſh the wonderfull works of God throughout the whole World. And foraſmuch as God of his free Grace has been pleas'd to bleſs me with the knowledge of this beſt and moſt powerfull of Medicines, though by reaſon of my weakneſs I am forc'd to keep my bed, and muſt patiently wait, till it ſhall pleaſe God to put me into a condition of preparing the ſame ; yea though Death ſhould prevent me from ever doing it, yet ſhall this be my ſatisfaction, that I have here informed the Lovers of Art, what wonder-working Tinctures lye hid in theſe deſpiſed Metals of Copper and Iron, and which may ſo eaſily with our Jovial Magnet be extracted.

But let him that undertakes to work with our ſecret Magnet, take heed that he do not make it too ſtrong, leſt inſtead of a Tincture, he draw the groſs Bodies ; for it often happens when the Magnet is too ſtrong, that, together with the Tincture, it draws the groſs Body, and eſpecially of the Homogeneal Metals, in which the Tincture is ſo cloſely united with the Body, that it is very hard to ſeparate them. A common Magner draws Iron, together with its Tincture, but without ſeparating the one from the other ; but our ſecret Magnet draws from Iron (its Body being firſt opened) the Tincture onely, leaving the groſs Body behind, becauſe Iron and Copper are Heterogeneous Metals, in which the Tincture is eaſily ſeparable from its Body, whereas Gold, which is Homogeneal, doth not readily part with his Tincture, the Body following its Soul or Tincture. Yea a common Magnet draws the whole Body of Iron, without ſeparating the Tincture, even then when by Nature it is made Homogeneal and fixed like Gold : as we ſee in Granat-ſtones, which are rich in Iron (as thoſe are which are brought to us from *America*, and eſpecially from *New-France*, ſome in great pieces and others ſmall like Sand) that they are greedily attracted by the common Magnet : and yet no Iron can be melted from them, foraſmuch as neither Fire will flux, nor corroſive Spirits diſſolve them ; but their Tincture may eaſily be drawn from them according to the way I have ſet down in my Book *of the Three Principles*. In *America* are found great Mountains of ſuch ſmall Granats, which being Homogeneal, will not yield to Fire or Stygian-waters. And now lately I have ſeen ſome Mineral Earths and Stones brought from *New-found-land*, of which there are whole Mountains there, which never any Man that I know could make any profit of, though it be certain that every pound weight of them contains half a Crowns worth of Gold and Silver. But we need not trouble our ſelves to ſeek for Treaſures in other Countries. God having furniſhed all parts of the World (none excepted) with Subjects that afford good and abundant Tincture, onely the Art of drawing them forth is wanting. We do not ſtand in need of Gold for to extract its Tincture, becauſe we may have one as good from *Mars* or *Venus*, and with much more eaſe.

But if any Man has a mind to draw the Gold from ſuch Waters, wherein it is imperceptibly ſcatter'd and diſpers'd, let him put a ſmall quantity of our ſecret Magnet into the ſaid Water, and he will ſee all the ſaid Gold preſently gathered to it, and reduc'd to Viſibility and Corporality, with great profit to the Artiſt. And becauſe many ſuch Waters abounding with Gold and Tincture, are found prepared

pared by Nature to our hands, without charges or trouble, this ſhort information here may to the skilfull open a door to great Treaſures.

But to proceed and ſhew that there are ſuch Magnets wherewith Tinctures may be extracted; and here firſt of all I will inſtance in my Jovial *Sal-Armoniack* here deſcribed, whereby the Tin turn'd to Aſhes is reduced; for when the ſame *Sal-Armoniack*, impregnated with Tin, is diſſolved in Spirit of Salt, it becomes ſuch a Solar Magnet, which can and does extract the Tinctures from the Solution of Metals. For when a little of this *Sal-Armoniack* Water is poured upon the Solution of any Metal, ſhaken together, and ſet aſide, the Magnet, as in a moment, attracts all that's good in the ſaid Solution, whether it be Gold or Tincture, to the bottom of the Glaſs of a purple or blood-red Colour, and the Solution becomes white. And yet there are many Magnets which are better than this of *Sal-Armoniack* impregnated with Tin, extracting the Tinctures from Metals with more eaſe, and better than that. The reaſon why I onely make mention of this, is, becauſe it is the product of the Work here deſcribed, *viz.* the extracting Gold and Silver from Tin. And to the end I may evidence to all, that the ſaid Magnet is of greater value than the Gold and Silver, which is got from the Tin; I ſhall ſay thus much, that it is impoſſible for the ignorant to believe of what great advantage this Magnet is to thoſe that underſtand the uſe of it: for not onely may Univerſal Tinctures be extracted therewith for curing the Bodies of Men and Metals, out of Metals and Stones, and that eaſily and without charge; but it can alſo extract much Gold from thoſe Metals and Stones, in which much volatile and ſpiritual Gold is hid, *viz.* Iron, Copper, *Eaſt-Indian* Zink, *&c.* and amongſt Stones the red and yellow Pebbles, which are almoſt every-where to be found. Concerning which extraction of *Sol* from Sand and Stones, I have treated at large in my Seventh Part of the *Proſperity of Germany*. Now that our Magnet draws to it all Colours and Tinctures, not onely from Stones and Metals, but from Vegetables and Animals, and doth highly exalt the ſame, may thus be proved: Diſſolve one ounce of Gold in *Aqua Regis*, pour the yellow Solution into a pound of common Water, and this yellow Colour will no more be perceived, then pour alſo ſome of our Magnet into the ſaid Water, and all the Water will become blood-red, and being ſet aſide, the Gold, which the Magnet hath attracted, falls to the bottom, highly exalted in Colour, and the Water remains white, having loſt all its Gold, and may be uſed again for the like extraction of Gold or Tincture out of Stones and Metals *in infinitum*, without any impairing of its ſtrength; ſo that I may well ſay, that never hath a more profitable invention been communicated to mankind.

Doſt thou deſire to experience what our Magnet can doe in extracting the Colours of Vegetables and Animals? then proceed thus: Boil Braſile-wood, Turmerick, or any like Vegetables in Water till it be coloured, filter it, and pour a little of our Magnet into the colour'd Water; ſhake it together, and the Magnet will draw all the colour from the Water to it ſelf, which falls to the bottom in form of a very ſubtil Powder; the Water being decanted, and the Powder dried, affords an excellent colour for Painters; Braſile-wood a brown red, Farnabock a light red, Dragon's-blood a bright ruby colour, Turmerick a yellow, and Indigo a curious Sky-blew. Animals, as Cochenille, *&c.* may be proceeded with in like manner, and will afford far better Colours than they can of themſelves, becauſe our Magnet (as hath been ſaid) exalts all Colours whatſoever. To try this thy ſelf, thou mayſt according to my foregoing inſtruction prepare it, and ſo find by experience the wonders it will perform in extracting the Tinctures of Metals, Stones, Vegetables and Animals; which if thou doſt, thou wilt find more than I have here ſet down. And if thou haſt no time to prepare the Magnet thy ſelf, thou mayſt have it of thoſe who prepare it in great quantities: For becauſe this wonder-working Magnet can do ſuch great things, I have communicated the preparation of it to a very honeſt friend, to the end he might make it in quantity, and vend it for the good of the World, at a Rix-dollar *per* Pound. With this Magnet Wool, Linnen, Silk, Bones, Feathers, *&c.* may be dyed or painted far more fair and laſting than any other way now known: Chymical Phyſicians, with the help of it, may prepare the true Quinteſſence of Metals and Stones for the cure of all diſeaſes: and it will aſſiſt the Philoſophers to extract Univerſal Tinctures from all coloured Stones and Metals, with which they may throughly and laſtingly tinge white metals to Gold, and Cryſtal to Rubies, Saphires, Jacinths, Emralds, *&c.* according to their pleaſure.

In a word, he who has this Magnet and knows the uſe of it, needs not to read any Chymical Books for all in all is comprehended in it, as in a ſhort time will be manifeſted. This Magnet is ſo great a Treaſure that the vaſteſt Volumes cannot contain all its virtues, it is ſerviceable to all men; yea no ſubject can be found in nature, that can produce ſuch wonderfull and uſefull effects as this our ſecret *Sal-Armoniack*. Great Books have been written concerning the common Magnet which onely draws Iron, though indeed its nature and properties be alſo very wonderfull; for without it there could be no ſailing by Sea in the Night time, whereas now it is all one to Marriners whether they Sail by Day or by Night: but how much more highly is our magnet to be eſteemed, which not onely points out to Philoſophers, Phyſicians and Chymiſts, the right way through the vaſt and wild Sea of Chymical Operations, to their deſired Port, richly laden with the beſt of Commodities Gold and Tinctures, but alſo directs Mechanicks to new ways and inventions of obtaining wealth, never before known.

Indeed as there is a great difference between *Mars* and *Jupiter*, ſo alſo between theſe Magnets which partake of their natures. The common martial Magnet guided *Chriſtophorus Columbus* to *America*, that new World abounding with Gold and Silver, beſides many other profitable Commodites, but all this in a way hazardous and full of danger, many thouſands having loſt their lives as well by Sea as by Land in endeavouring to obtain theſe riches. For *Mars* with his Magnet onely loads and perſwades to War and Blood-ſhed, whereas the friendly and peace-loving *Jupiter*, with his benign Magnet ſtirs up none to evil but onely to good, and directs us to a Land much more abounding with Gold than *America*, whence we may fetch the ſame in peace and quiet without fear of War or Blood-ſhed, and to the glory of God make known his Works of wonder to the ignorant.

And thus much ſhall ſuffice to have ſpoken concerning the extracting or ſeparating of Gold and Silver from Tin, and the eaſie extraction of Tinctures from Stones and Metals, by means of our ſecret *Sal-Armoniack*. Now for a Surplus, and to pleaſure the Sons of Art, I'll take one turn more in the Philoſophick Garden and gather ſome fair Flowers, to make a Garland in honour of the Adepts, that they may wear it in remembrance of me. The firſt of theſe Flowers is the white Lilly, the ſecond the blew Violet, and the third the deep Purple *Amarantbus*, being the chief that grow in our Garden, of which I intend to twiſt my Garland.

The firſt, *viz.* the white Lilly appears in the beginning of our Work; the blew Violet in the midſt, and the deep red *Amaranthus* in the end of it. That I compare the beginning of our Work to a Lilly, is not without reaſon, foraſmuch as our mercurial Water is whiter than white, being called of Philoſophers a white, whiter than white, becauſe though it be a white colour, yet it excells all other whites, with its gliſtring brightneſs ſo far, that other white colours compared with it look very dim and dark. And becauſe God hath beſtowed upon the Lilly ſuch a fair gliſtring white, as no Flower can compare with it, therefore we compare our mercurial Water (the beginning of our Work) for its unparallel'd whiteneſs to the Lilly of the Field: of which our Saviour himſelf ſaith, *That* Salomon *in all his glory, was not arrayed like one of them*. For this cauſe alſo the Philoſophers always termed the beginning of their Work a white Flower, as appears (among other inſtances) from an inſcription engraven on two Candleſticks, belonging to a Cloiſter in *Weſtphalia*, made by a *Monk* and dedicated to the uſe of the Altar there in theſe words, *Non ex Auro, nec Argento ſed ex primo Artis flore ſum factum. I am not made of Gold nor Silver, but of the firſt Flower of Art.* Theſe Candleſticks are white as Silver, but heavy as Gold; which may paſs for a proof that the white in our work is termed a Lilly or Flower.

And that this our bright white Lilly doth far ſurpaſs all other white Flowers whatſoever, the Philoſophers in *Turba* witneſs when they ſay, our Salt exalts the whiteneſs in Silver and the red in Gold; which indeed is the very truth, though it be not believed by the unexperienced, becauſe at firſt ſight it ſeems againſt nature, that one colour ſhould die both red and white: yet that it is ſo, I here witneſs unto with my Pen, and hope ſhortly to make an ocular demonſtration of it to all that are lovers of the wonderfull Works of God. In the mean time we may prove it thus, diſſolve in *Aqua Fortis* ſome fine cupell'd Silver, and in another Veſſel in *Aqua Regis* ſome find Gold, pour a little of our mercurial Water into each of the Solutions, and the Silver will fall to the bottom white as Snow; yea rather will be whiter than that or any other thing in the World: and the Gold will be precipitated red like blood, and the Stygian Waters are rob'd of all the Gold and Silver that was in them, by the addition of our ſecret *Sal-Armoniack* Water, ſo as not the leaſt grain remains with them. Thus *Perſeus*, viz. the exalted Gold, has deliver'd *Andromeda*, viz. the white exalted Silver, from the Sea-Monſter, *viz.* the *Aqua Fortis*, and taken the ſame to his Wife, that is, radically united with it. And that our jovial *Sal-Armoniack* will do this, I hope e're long to demonſtrate to the lovers of Art.

The Blind World may learn from hence, it was not without reaſon the Philoſophers affirm that their ſecret Salt, exalts the red in Gold and the white in Silver. And that their Salt is a *Sal-Armoniack*, appears from their crying, *O our* Sal-Armoniack *! O our Sea!* for had it been the common, how could they have call'd it theirs? *Turba* ſaith, *If the Almighty had not created this Salt, it were impoſſible to compleat our* Elixir: Which words are alledged by *Arnoldus de Villa Nova*, who ſaith that *Almizadir* (a name the Philoſophers give their ſecret Salt) is a *Sal-Armoniack*, as appears from his own words taken out of his Breviary of Alchymical Books, being a Letter of his to a Pope of *Rome*.

" To the moſt holy Father, e're I acquaint thee " that firſt of all the bodies muſt be reduced to their " firſt matter. To underſtand which, thou muſt " know, that the matter of all Metals, and their " Sperm is a white fume decocted and thickned in " the Bowels of the Earth, by a ſulphurous heat; " and according to the varieties of this Sulphur, and " its quantity in the earth, divers Metals are pro- " duced; the matter of them all being the ſame eſ- " ſentially, and differs onely accidently. Above all " things it is certain, that the Workman can do no- " thing here without Salt, no more than an Archer " can ſhoot without a ſtring to his Bow. *Morienus* " expreſſes this more clearly, when he ſaith, *Take* " *the Phlegmatick and Cholerick, and grind the Sanguine* " *with it, untill it become a tinging Heaven*, &c. The " Phlegmatick is cold and moiſt, *viz. Mercury*, the " Cholerick is hot and dry, *viz. Sal-Armoniack*, " and the ſanguine is hot and moiſt, *viz.* Gold. " Obſerve that *Sal-Armoniack* doth not give Co- " lour, but Ingreſs, and prepares the matter and " purgeth it, and then the Spirit being united with " the Body, it hath ingreſs, and having conjoin'd " theſe, it goes off. For this Salt is an unctuous " fatneſs coagulated by the dryneſs of the fire, of " a hot and ſubtil dry nature, which penetrating " through all parts, diſſolves Bodies, and is the " conjoiner of oppoſites, and of all Spirits with their " Bodies. For this Salt is a volatile Spirit, a gene- " rating Stone, and a helper towards the productio- " on of the Elixir; becauſe if this Salt were not, " the Elixir could never be diſſolved, nor have in- " greſs, neither would one thing be join'd to ano- " ther, or have ingreſs into another. It is volatile, " and yet join'd with Bodies, it is a Body which is " hid in it. And therefore *Avicenna* ſaith, *If you* " *put* it, *viz.* this Salt, *inſtead of Fire, Air, or Sul-* " *phur, you will not err in your work, becauſe it inclines* " *it ſelf to every nature and Almizadir*; that is, Sal-Ar- " moniack *will alone do thy buſineſs*. And in the Book " of Aloms and Salts 'tis ſaid, that *if God had not* " *created this Salt, the Elixir could never be perfected,* " *and the ſtudy of Alchymy would be in vain. He* " therefore *that works without Salt* (as the Allego- " ry of the Wiſe Men hath it) *does not attenuate the* " *dead Bodies in their Graves, and therefore can never* " *expect a reſurrection*, &c.

From this Letter of *Arnoldus* it appears fully, that their ſecret Salt is a *Sal-Armoniack*, though not the common. Concerning which Salt the Philoſophers expreſs themſelves very differently. Our *Coſmopolita* cries out, *O our Sal-Armoniack! O our Sea!* and teaches alſo the preparation of it, though very darkly, where he ſpeaks of the little fiſh *Remora*, of which we are told, that it is able to ſtop a great

a great Ship under Sail in her courſe; and we know our ſecret *Sal-Armoniack* has the force to ſtop the Ships richly laden with Gold and Silver, ſailing in the Sea of *Stygian* Waters, and to lead them whither it lifts; from whence it appears that our Jovial *Sal-Armoniack* is the true *Remora* of the Philoſophers.

I proceed now to the ſecond Flower, *viz.* the blew Violet, which is likewiſe found in our Garden. We have heard how by means of our Jovial *Sal-Armoniack*, the colour of Gold and Silver is exalted, after it hath attracted them out of the ſalt Sea, wherein they were diſſolved. But if the Solutions of both Gold and Silver be pour'd together in one Glaſs, and ſome of our Magnet be put to them for to attract the ſame, then the Gold which before was Blood-red, and the Silver which was ſo white, do together conſtitute a Violet colour, which is the ſecond Flower growing in our Garden.

The third and moſt beautifull Flower of all that grow in our Garden, is the fair Flower *Amaranthus*, which of all other doth longeſt keep its colour: the white Lillies ſhed their Leaves as ſoon as they are ripe, and Violets in a ſhort time wither and loſe their colour; but the *Amaranthus* keeps her colour Winter and Summer. And the ſame may be ſaid of our metalline Flowers, the Silver attracted by our Magnet is the white Lilly, which when joyn'd with our blood-red Gold, produces our blew Violet, and out of this Violet, by means of the Fire, is afterwards produced the fix and permanent *Amaranthus*. When a Philoſopher knows where to find, and how to pluck theſe three Flowers, he may well wear them as a Garland of Honour. Thus much I have added to point out theſe Flowers to the Sons of Art, and to ſtir up a deſire in them to pluck them for themſelves. At the preſent, time doth not permit to add any more, wherefore I hope the Courteous Reader will accept of what he finds here, intending in my third Appendix, God willing, to ſpeak more fully of other like Flowers, which with the help of our ſecret *Sal-Armoniack*, may with more eaſe and in greater abundance be gathered than thoſe now mentioned. I intend alſo therein to treat of a far more profitable uſe of our ſecret *Sal-Armoniack*. For although our ſecret *Sal-Armoniack*, which by manual labour is prepared of two Contraries, *viz.* Oil of Vitriol, Spirit of Salt or other corroſive acid Spirits, and urinous Spirits, be of great uſe for the meliorating of Metals, and the preparing of many good Medicines, yet is all this but Children's play, if compared with what may be done with our moſt ſecret *Sal-Armoniack*, which is not prepared by Art, but created of God, and may be had every where in abundance without money. Yea, the Philoſophers ſay that all men have it, that *Adam* brought it with him out of *Paradiſe*, and after death took it with him to his Grave; which is the conſtant aſſertion not onely of Heathen, but alſo of Chriſtian Philoſophers, who have aſſerted the ſame with many arguments, amongſt whom are *Albertus Magnus* and his Diſciple *Thomas Aquinas*, who were holy and religious men, and therefore very far from obtruding lies upon the World. There are alſo many Writings of unknown Philoſophers, who aſſert, that all both rich and poor, always carry the matter of the Stone about with them, yea, that they bring it with them from their Mothers Womb: which though it may ſound ſtrange to the ignorant, becauſe Man doth not appear in a mineral form, but in Fleſh and Blood, yet ſure it is that the mineral virtue is hid in him, for if it were not ſo *Albertus* could never have found Gold between the Teeth of dead Mens Skulls.

And for a concluſion, I *Glauber* do here proteſt, that this moſt univerſal *Sal-Armoniack* is able to change common Mercury in two or three days time, that it ſhall be no longer Quickſilver, nor whiten *Sol Lune* or Copper, but rather exalt them in their colours, and change them into true Tinctures. This *Sal-Armoniack* alſo has the power to fix (though it be unfixt it ſelf) all volatile Minerals, *viz.* common Sulphur, Mercury, Antimony, Auripigment, Zink, Biſmuth, Arſenick, Cobalt, Galmey, and other ſuch like in twenty four hours, ſo as afterwards they will ſuffer themſelves to be melted, without ſending forth any ſmoak, and may be taken inwardly for the cure of many Diſeaſes, concerning which I intend ſuddenly to give a fuller and further account. And therewith conclude this ſmall Treatiſe of the wonderfull Powers and Virtues of our ſecret Artificial, and moſt ſecret natural *Sal-Armoniack*. The godly and upright will eaſily apprehend what is here written, but the ungodly never. In our third Appendix we intend to enlarge on theſe and the like high Secrets, and declare the further profitable uſe of our Mercury of Tin, as being the onely means, without troubleſome or chargeable labour to obtain to an univerſal Medicine.

The End of the Second Appendix.

THE

THE THIRD APPENDIX TO THE SEVENTH PART OF THE Spagyrical Pharmacopœa.

Wherein is Treated of the Further Uſe of our Wonder-working *Alcaheſt* or moſt ſecret *Sal-Armoniack*. And more particularly, of the way to Extract the Tinctures of Gold, Iron and Copper; as well as of all precious and common Stones; and to introduce the ſaid Tinctures again into other white Metals and Stones, ſo as permanently to colour and meliorate the ſame.

Faithfully Tranſlated out of the High-Dutch *Original.*

Courteous READER,

IN the fore-going Second Appendix *to my* Pharmacopœa Spagyrica, *I promis'd the publiſhing of a Third* Appendix, *wherein I intended to communicate to the Lovers of Art, the remaining Vertues of our* Secret Sal-Armoniack; *but finding that my Candid publication of ſo many great and uſeful Secrets are ſo coldly and careleſly received by an ungratefull World, I have thought good to cover the ſame in ſilence. However that I may not be wanting to contribute what I can in this my Third* Appendix, *for the ſatisfaction of the ingenious Seekers and Lovers of Art, I deſign to conclude my* Spagyrical Phamacopœa *with the Diſcovery of a* Wonder-working new-found-Alcaheſt, *which by its ſurpaſſing Virtues does far excell all thoſe before-mentioned. Which new Diſcovery will without doubt be more acceptable to the Lovers of theſe Secrets, than to Treat further concerning the already Communicated* Sal-Armoniack; *which whoſoever ſhall take the pains to prepare, will find much more than I have ſet down concerning it; and therefore think it not needfull to enlarge any further on that Subject, in the mean time neglecting things of greater and better concern. I ſay better things, becauſe the diſcovering of this* New-found Alcaheſt *will afford more light by far to Seekers, than the former could: For which reaſon I have thought good to ſet all other things aſide, for to Treat of the* Alcaheſt *which has not its like in the Univerſe, as I hope by God's aſſiſtance in this Diſcourſe to make out and demonſtrate.*

Now

NOw becauſe I here write of an *Alcaheſt* or *Wonder-working Sal-Armoniack*, I think it not improper to explain the word *Alcaheſt*, and to make known the meaning and importance thereof, which may help us to diſcover the true Uſe and Vertues of the ſame. Some tell us that the word *Alcaheſt*, is a Corruption of the *German* word *Algeiſt*, that is to ſay, *All-Spirit*, from its very ſpiritual nature, and becauſe it reduces groſs Bodies to Spirit. Others by tranſpoſing of its Letters, make a *Dutch* word of it, importing *haſty or ſwift running, flying*, &c.

Now we know that among all Salts that are in the World, there is none to be found, which in Diſtillation or Sublimation doth ſooner volatilize the moſt ſubtil part of Minerals, Vegetables, and Animals, and carry them over the helm, than a good *Sal-Armoniack*: Wherefore the ſaid Name may well be given to it, by reaſon of its volatilizing all things, and carrying them ſwiftly over the helm.

And foraſmuch as I have already ſpoken cconcerning ſeveral of theſe volatilizing Salts, calling the firſt *Common Sal-Armoniack*, the ſecond *ſecret Sal-Armoniack*, and the third *moſt ſecret Sal-Armoniack*, I find my ſelf deſtitute of a Name by which I might call this my New found *Sal-Armoniack*, except I ſhould give it the name of *Eagles Wings*, which I am the rather inclined to do, becauſe in ſome of my former Writings, I have by way of Alluſion expreſſed the ſaid Volatilizing Salts by the Name of *Wings*, comparing the firſt and weakeſt of them to the wings of a *Dove*, the ſecond to thoſe of a *Raven*, and the ſtrongeſt of all to *Eagles wings*. And ſeeing the *Sal-Armoniack* of which I am now to Treat, is far more powerful than any of them all, I may well give it that name, and the rather, becauſe Antient as well as Modern Philoſophers have given the name of *Eagles wings* to common *Sal-Armoniack*; ſome of them, 'tis like, not knowing of any better. Thus *Paracelſus* ſets down the way of volatilizing his *unripe Mineral Electrum* by means of the Spread *Eagles wings*; and in many other places of his Writings, he calls *Sal-Armoniack* an *Eagle*, becauſe this Salt, of all Salts, as the *Eagle* of all Birds, takes the higheſt flight, and therefore alſo is called the King of Salts.

The *Heathens* attributed a Flying *Eagle* to their cheifeſt God *Jupiter*; and the Holy Apoſtle and Evengeliſt St. *John*, becauſe in his Goſpel he takes a higher flight than any of the other Evangeliſts, is repreſented with an Eagle ſtanding by him, as being his proper Embleme. We alſo find in the Writings of Philoſophers, the word *Eagle* is made uſe of by them to ſignifie any thing which by Art is exalted to the higheſt degree it is capable of; and therefore this *Sal-Armoniack* which in its flight excells all thoſe before ſpoke of, exalting things to the higheſt top of Perfection, may well be ſtyled the *Eagles Wing*. *Pliny* makes mention of a great and monſtrous Bird called a *Griffon*, found in the Eaſtern parts of the World, and of that ſtrength, as to be able to carry away an Armed Man on Horſeback, Horſe and all, to his Neſt: which ſtrong Bird is a good Embleme of the ſurpaſſing force of this our *Eagles wing*, which like the *Griffon* is alſo provided with ſtrong Talons, with which it lays hold on heavy things, and carries them away with it, as we ſhall hear by and by. For every good *Sal-Armoniack* hath theſe two Vertues, of being ſharp and piercing as well as volatile: the ſharpneſs are its Talons, whereby it ſeizeth and lays hold of things; and its volatility, are the Wings with which it carries them away. Now the ſtronger theſe talons, and the larger theſe wings of *Sal-Armoniack* are, the more will thereby be effected: The Common *Sal-Armoniack* is the weakeſt of all, our Secret *Sal-Armoniack* is as ſtrong again, and our moſt Secret *Sal-Armoniack* far excells them both; but this we treat of here, is by much the ſtrongeſt and moſt active of them all, and therefore may well be compared to the King of Birds.

This ſame *Sal-Armoniack* may alſo with great reaſon be called *Lucifer*, as affording a bright-ſhining Light to Chymiſts, whereby they may diſcover great Secrets: For as the bright Morning Star in the Firmament, does go before the *Sun*, and gives notice of his riſing, and therefore is called *Lucifer*, that is the Harbinger or Bringer of Light. And as the ſaid Star doth not only Uſher in the Day, but alſo ſhut the ſame, and bring on the Night, being therefore alſo called *Veſperus*; we ſhall find a fit reſemblance of all this in our Philoſophick *Lucifer*, foraſmuch as the ſame makes known and diſcovers to us, the riſing as well as ſetting of our Spiritual *Sun*, and is a double Key which ſhuts as well as opens.

But to ſhew more particularly that my New found *Alcaheſt* or Spiritual *Sal-Armoniack*, hath this reſemblance with the Morning-Star, *Lucifer*; I ſay, that, as the ſaid Star uſhers in the *Suns* riſing; ſo likewiſe our Sophick *Lucifer* goes before our Spiritual *Sun*, and uſhers the ſame over the Helm. And as the Firmamental Sun, when it riſeth above the Horizon, doth by its Light, and Vital heat quicken, vigorate and refreſh every thing; in like manner our Philoſophical Sun, or Spiritual Gold, when by means of our *Lucifer*, it is brought from under its earth or dark *Chaos*, quickens and rejoices whatſoever is contain'd within the compaſs of our Sophick Heaven.

And as in the Heavens the *Sun's* riſing follows ſoon after the appearing of the Morning-Star, following the ſame, as it were, at the heels; ſo likewiſe our *Lucifer*, when by the Artiſts, She is joyned with the dark *Chaos*, in which the Sophick Gold lies hid, and begins to feel the Fire, ſwiftly comes over (for ſuch is the nature of an *Alcaheſt*) and brings tidings of the Philoſophick Suns riſing, which indeed follows it at the heels. Again, As the *Sun* of the Firmament, leiſurely follows the Morning-Star, not leaping forth all at once; ſo our Sophick *Lucifer* brings over Gold, not all at once, but gently and by degrees, at firſt appearing very little, and afterwards diſcovering it ſelf more and more, till at laſt it ſhine forth in its full Meridian Glory.

Neither ought it to be thought ſtrange, that I compare our *Alcaheſt* to *Lucifer*, our Gold to the *Sun*, and our *Alembeck* or Veſſel to *Heaven*; ſeeing that others have done the ſame before me, and particularly *Hermes Triſmegiſtus* the Father of all Philoſophers, has made uſe of this Allegorical way of expreſſing himſelf in the deſcription of his *Univerſal Tincture*, as may be ſeen in his *Smaragdine* Table at the latter end of *Mirac. Mundi*.

Thus the *Reader* may ſee how the Philoſophers of old took pleaſure to repreſent their high Secrets in Parabolical expreſſions; which may further be traced in *Morienus* his Deſcription of the *Univerſal Tincture*, in *Paracelſus* his Book entitled *Cælum Philoſophorum*, which contains great Secrets concerning the Tranſmutation of Metals, but much in Symbolical, and Allegorical expreſſions.

But to return to our *Alcaheſt*, whoſe name imports a ſtrong Spirit which lays hold of Heavy and fix things carrying them upwards with it ſelf, that is Volatilizing them. The *Eagle*, as a King of Birds, ſeizeth

Hens, Gees, Hares, *&c.* with his Talons, and carries them up to his Neſt; but as for what *Pliny* writes of the *Griffon*, ſeems rather an Allegory than a true Hiſtory, becauſe *Pliny* among other things relates of this Bird, that with her ſtrong Talons ſhe digs up Gold from out of the high Mountains and Rocks, and makes her Neſt with it: Now how improper this is for a Bird to make her Neſt with Gold, and not rather with Feathers and other ſoft materials, is apparent enough at firſt ſight. Wherefore we may ſafely conclude, that the Ancients by this great and ſtrong Bird, have denoted to us a violent and high volatil *Alcaheſt*, ſuch as ours is, which lays hold not only of the Spiritual, but alſo of the Corporal Gold which is in Metals, Stones and Rocks, and plucks up the ſame with its ſharp Talons, and with its ſtrong Wings carries up the ſame to the tops of Mountains, there to make her Neſt. Thus we ſee how this Story may be verified: For indeed the Talons of our *Alcaheſt* are much ſharper, and her Wings much ſtronger, than thoſe of the *Eagle* or *Griffon*; for when we pour the ſame upon any colour'd Metals or Stones in a Glaſs placed in a heat of Sand, it preſently lays hold of them, and digs up not only the fix Gold that is in them, but alſo all their fix and volatile Tincture, and carries it to the top of an high Mountain, that is the head of the *Alembeck*. Nor doth it only exert its power upon imperfect Metals, or upon Sand and Flints, which are of a Diſſimilar and Heterogeneous nature, and therefore more eaſily ſeparable, but ſhews forth alſo its ſurpaſſing ſtrength, upon fix Gold and hard precious Stones, which are Homogeneous and of very difficult Separation, penetrating their compact and ſhut-up Bodies, drawing from them their fixed Tinctures or Souls, and carrying them up to the tops of *Olympus*. Neither doth it only extract Tinctures from diſſolved Metals and powdred Stones, but alſo from thoſe that are whole and entire, robbing them of their Tinctures without deſtroying the frame and figure of their Bodies, which indeed is wonderful. And as it thus extracts theſe Tinctures, ſo it can wonderfully introduce the ſame again into other hard and compact Bodies: All which it performs by reaſon of its ſurpaſſing ſubtile and piercing nature; as being neither Earth, Water, nor Air, but a meer Fire, penetrating all things, and which nothing can withſtand or reſiſt.

Take this inſtance of it; Fill a Glaſs-body with Earth, Water, or Air, and you'll find that none of them will be able to penetrate the Glaſs, but put Fire into it, and it will pierce the ſame without the leaſt reſiſtance. Wherefore the Philoſophers ſpeaking of our Secret Fire, ſay: *Our Fire is ſtronger than the Common, becauſe it turns Gold that is moſt fix into a meer Spirit, which common Fire can no way perform.* All men know that Gold cannot be deſtroyed by any common Fire, whereas our ſecret Fire carries over Gold in form of a Spirit, as if it were a volatile Mercury: Judge then whether this be not a wonderful Fire, which as it were in a moment, makes fix Gold ſpiritual and potable.

We read in the Scriptures, that the *Iſraelites* forced *Aaron*, in *Moſes*'s abſence, to make them a Golden Calf for to Worſhip; and that when *Moſes* was come down from the Mount, and ſaw the Children of *Iſrael* dancing about the Golden Calf, *his anger was kindled againſt them, and burning the Calf with fire, he ground it to powder and ſtrewed it upon the water, and made the Children of Iſrael to drink of it*, Exod. 32. 19, 20. Now whether it was by Art, or by the immediate power of *God* that *Moſes* ſo burnt the Golden Calf, that the *Iſraelites* could drink it down, we will not now diſpute; thus much we know, that it could never be done with common Wood or Coal fire. Beſides, we know that *Moſes* was not defective in any thing of Art or Knowledge, as having been educated and inſtructed in the Royal School of *Pharaoh*, in which true Philoſophy, Aſtronomy, Magick, Alchimy, and Phyſick at that time greatly flouriſhed. We read of the Holy Apoſtle and Evangeliſt St. *John*, a thing no leſs ſurprizng and wonderful, *viz.* that he turn'd Rods to Gold, and common Stones into Gems, which he diſtributed to the Poor; as is expreſt in the *Latin* Hymn the *Roman* Church ſings in honour of that Evangeliſt, on the Feſtival-day appropriate to him. I am not ignorant that ſome are of opinion that St. *John* could never do this by art, becauſe he did not make uſe of the proper matter for Tranſmutation, but by the immediate power of *God*, which I will not now determine; only this I can ſay, and if need were, make an Ocular demonſtration of it, that out of Wood, and other Vegetable and Animal ſubjects, none excepted, good Gold, abiding all proofs may be made, though with more eaſe out of one Subject than another. For indeed the Principles of Metals are as well to be found in Vegetables and Animals as in Minerals, though ſomewhat more remote and inviſible, than in theſe. That Wood contains a Sulphur like to that which is found in Metals, none can deny, and I have demonſtrated in many places of my Books; neither is it deſtitute of *Mercury* and *Salt*. Wherefore I here openly profeſs, by an impulſe from *God* and Truth, that it is no hard thing for me, out of all Vegetable and Mineral Subjects to make good Gold, by means of our fiery maturating Spirit, to which in this Treatiſe I have given the names of *Alcaheſt*, *Eagles wings*, *Griffons talons*, and *Lucifer*.

The Ancient Philoſopher *Artephius*, has not ſpecified the time, in which his Secret fire can maturate the true ſubject of the Stone, and bring it to perfection. *Pontanus* ſaith it may be done in a ſhort time, and with ſmall charges. 'Tis probable that *Moſes* ſcarce ſpent one day in burning the Golden Calf with the Sophick fire; neither is it likely that St. *John* made any long work, of changing Wood into Gold, and common into precious Stones. If *Miriam*, *Aaron's* Siſter, could in three days time compleat the Philoſophers Stone from beginning to end, (according to the Teſtimony of Philoſophers) why may not there ſuch enlightned Perſons be found at this day among good Chriſtians that can do the ſame? The ſame *God* who gave this knowledge to *Moſes* and *Miriam*, as alſo to the Evangeliſt St. *John*, he lives ſtill, and ceaſeth not by his Holy Spirit, to enlighten his Elect, without any Verbal Diſputes, reading of Books, Labour, Wearineſs, or Charges, in all Divine and Eternal, as well as Temporal and Natural things, and to lead and conduct them to their deſired end. Wherefore all ought in the firſt place to beg of *God* his Light, Underſtanding, and Wiſdom, as *Salomon* did, and not to ſeek after vain and periſhable Riches, by which means they would obtain much more than they ever can by their own willing and running. I *John Glauber* affirm it boldly, that with our ſecret Fire, I can in the ſpace of three hours, make pure natural fix Gold to be as volatile as any Spirit of Wine can be; and again in twenty four hours-time, turn the ſaid ſpiritualized and exalted Gold, into a fix tranſparent, ſpiritual, ſweet, tinging Carbuncle: and this in the way of Nature, to the wonder and aſtoniſhment of the ignorant Covetous Children of this world, that walk in darkneſs;

and

and yet (as *Chriſt* ſaith) are wiſer in their Generation than the Children of Light.

Let this ſuffice what we have here ſpoken concerning the power and great vertue of our *Alcaheſt*, in preparing of Medicines and Univerſal Tinctures, *viz.* that whatever Metals, common or precious Stones, are put into it, it immediately does volatilize the ſame, and brings them over the helm, carrying them upwards, to what height we pleaſe; for ſure it is that the higher Metals mount in diſtillation or ſublimation the purer they are. When now ſuch pure and ætherial Spirits, are again fixed, then they are no more groſs Metallick Bodies as before, but Spiritual Bodies, and Bodily Spirits; to the Eye Clarified Bodies, but indeed and in truth Concentred Spirits, which penetrate all hard things whatſoever, paſs through lock'd Gates, and take away what pleaſeth them; and as they can without opening the door take out any thing, ſo can they in like manner bring in the ſame again. As for inſtance, I draw the Colour from Gold, and introduce the ſaid Tincture into Silver, being a fix pure and white Body, in which this Metalline Spirit takes up its abode; and the pure body of Silver greedily attracts the Tincture, becauſe ſhe ſtands in need of it; neither indeed can the porous body of Silver, reſiſt or keep out this piercing Spirit, but paſſeth through warming and tincturing her throughout, and filling her pores with Solar Tincture, communicates to her not only the colour and weight, but alſo the nature and property of Gold.

Take another Example: Extract with our *Alcaheſt* by Diſtillation the fix Tincture out of Granates (not pulverized, but whole as they come to hand, and that for reaſons hereafter mentioned) which extraction may be performed in half an hours-time, becauſe our *Lucifer* can paſs through ſhut gates. When now thou haſt caught this Tincture in our Helliſh Spirit, then thou haſt it at command, and it muſt obey thee. If then our fiery Magnet be able to extract the Tincture from hard Stones, without breaking, or deſtroying their bodies, it can as eaſily introduce the ſame again into any hard, white ſtony body, and colour the ſame, light or deep, as pleaſeth thee beſt. For inſtance thou draweſt the colour from Granates, which indeed do ſuperabound with tincture, which renders them opacous, and therefore leſs eſteemed; for we find that a Ruby being of a lighter colour, that is leſs abounding with Tincture than a Granate, is much more valued, whoſe Bodies nevertheleſs do in all things exactly reſemble one another, differing only by reaſon of more or leſs Tincture. Indeed where the bodies differ in hardneſs and clearneſs, there the caſe is alter'd; but when the body is fixe, and can endure the fire, onely 'tis darkened by too much Tincture, this may eaſily be mended by art, onely by extracting or taking away ſome part of its Tincture, which will render it of a brighter colour. Which extraction of Tinctures, and the introducing of them again into pale or white bodies, may be practis'd upon all precious Stones, and to very great profit. For example, I draw, by means of our ſecret fire, the Tincture out of Gold or Granates, and Introduce the ſame into another white Stone, which muſt be fix, that is, ſuch an one, which when made red hot, doth not become ſoft or fall to ſhivers, but retains its former hardneſs, as all thoſe do which are called precious, becauſe the fire can neither conſume nor ſeparate their parts, ſuch as are Diamonds, Rubies, Granates, Saphires, Hyacinths, Emralds, Topaſes, Chryſolites, Amethiſts, *&c.* All which are coagulated of one and the ſame water, and tinctured with the ſame colour; for though their colours differ, that proceeds only from the greater or leſſer quantity or purity of their Tinctures, their colours, as well as their bodies proceeding from one principle. And the ſame muſt be underſtood of all Metals; for Gold has no better original than Iron or Copper, ſave only that by long diſtillation in the Earth, it is better purified and ripened. Obſerve only that in this operation you do not take Criſtals, Beryls, or any other Stones which grow ſoft and crumble to pieces when they are made red hot.

Some Jewellers know with the help of Fire, to mend ſome precious Stones whoſe colours are not bright and clear enough: thus they burn away the colour that is in Saphires and Amethiſts, making them white like Diamonds, their colours being volatile, and therefore may be taken away by Fire, but they can not introduce other colours inſtead of thoſe they have rob'd them of. Neither are they able to burn yellow Diamonds to a whiteneſs, notwithſtanding that Art has been much ſought after: But our *Alcaheſt* can eaſily perform this Maſter-piece, for as much as it, like a ſubtil piercing fire, can paſs and repaſs through ſhut doors without impediment, whereas all groſs, corporal things are fain to ſtand without. For which reaſon I have given our ſecret Fiery Spirit, the name of *Lucifer*, of which *Artephius* ſpeaks thus: *Our Fire is moiſt and dry, it pierces all things, diſſolves, volatiliſeth, and alſo fixeth them; it is natural, unnatural, and ſupernatural:* For though Nature make Gold and Precious Stones in the Earth, yet doth it not afford us ſuch a ſupernatural Fiery Spirit or Stone with which we at our pleaſure can make Gold and Precious ſtones of Earth. Therefore it is Art that brings things higher and further than Nature can, and yet the Artiſt cannot go beyond Nature, except he have firſt learnt to know Nature and taken his Principles from her. Now we know that Spirits, whether they be hot or cold, light or dark, good or evil, are of more power and efficacy than groſs Bodies, for which reaſon God, who is Light and Life, and his Adverſary Satan, who is Death and Darkneſs, have ſo great power: Though indeed the Darkneſs hath no more power than the Light allows or permits it to have: For the Light rules over the Darkneſs, ſo as the Darkneſs can do nothing againſt the Light, of which matter I intend, *God* willing, to Treat further in my ſecond and third Purgatory.

In the mean time we have here ſhewed, how by Art ſuch powerful Spirits may be prepared, as can effect things ſupernatural; for which reaſon, amongſt others, I have given our *Alcaheſt* the name of *Lucifer:* for *Lucifer* was in the beginning with *God*, an Angel of Light, whereas now he is caſt into utter Darkneſs; ſo likewiſe our Incomparable Wonder-working *Alcaheſt* in its firſt preparation, is a bright Fiery Spirit of Light, but after its coagulation, it becomes a ſpirit of Cold and Darkneſs, binding all volatile Spirits, whereas before it made all fix things volatile and ſpiritual. Which that I may more fully evidence to the Ignorant and Incredulous, I ſhall give an Inſtance thereof firſt in Gold, and then in Precious Stones.

A PRO-

A PROCESS,

To draw the fix Tincture from Gold, and to make it Spiritual and Potable, fit for the Phyſicians *uſe, and that eaſily, in a ſhort time, without any conſiderable Charges; and how the ſame exalted Spiritual Gold may be changed into a clariſied, tranſparent, tinging, fix Carbuncle.*

TAke of the filings of Gold, or beaten Gold an ounce and half, or an ounce and quarter, put it into a little, but ſtrong Glaſs body, pour upon it two or three ounces of our beſt *Alcaheſt*, fit a head to it, cloſing it well with a paper dipt in Oyl, apply a great Recipient, and lute it very carefully, for when the Spirit comes over, it paſſeth with great violence, and ſearches every where for vent, being the moſt ſubtil of Spirits, and very fiery withall: Wherefore take great care that your Lute be good, or elſe you will never be able to retain this Corroſive fiery ſpirit. The Veſſel muſt ſtand in Sand, and a very gentle Fire adminiſtred at firſt, that our ſecret ſpirit may by degrees grow warm in the Glaſs, and not be too ſuddenly heated, for in that caſe it would be apt to fly away without its prey: But if you proceed, as is directed, then our moiſt fire will lay hold of the Gold, and carry it over in form of a Spirit, but leiſurely and by degrees, at firſt only of a yellow colour, which afterwards comes higher and higher. Towards the latter end the fire muſt be encreaſed, till the bottom of the Glaſs be red hot, at which time the heavy ſpirits will come over, bringing the heavy Corporal Gold over with them, a red fix ſalt ſtaying behind, which is of great uſe in Phyſick and Alchimy, as we ſhall ſee hereafter. The yellow ſpirit, as well as the red ſalt, may, without any further preparation be uſed outwardly and inwardly (the ſtrength of them being qualified with Water, or other Liquors) and by reaſon of their aſtringent property, corroborate the Stomach of ſuch as are old and cold, procure Appetite, conſume tough Phlegm and ſlimy Matter in the ſtomach, help Concoction and ſtrengthen the Heart, Brain, and all outward and inward parts of the Body; open all Obſtructions, by reaſon of the fiery ſubtil ſaline ſpirit joyn'd with them, penetrating and cleanſing the whole Body, and perform all that can be expected from a true Potable Gold.

But in order to our Metallick Tranſmutation, this Solar ſpirit muſt be reduced to a fix, ſweet, tranſparent, and all-penetrating Stone; the way and manner of doing which, we ſhall declare hereafter. Now in caſe we would have this our Golden ſpirit, to produce more wonderful effects in Phyſick, as well as in the Tranſmutation of Metals, then proceed thus: Take of Gold one part, of the Martial *Regulus* of Antimony two parts, melt them together, pour them forth, and the Gold will be white and brittle; pulverize the Maſs, and put it into a ſmall Glaſs body, and pour upon it three times as much of our fiery *Alcaheſt*, and by degrees abſtract the ſame, and you'll have a higher and better Tincture than from the Gold alone. For *Antimony* is the *Aries* of the Chymiſts, wherein *Sol* hath its exaltation. This red Oyl of Gold and Antimony, may eaſily be changed into an Univerſal Medicine or Tincture, by means of our Catholick Coagulator.

And as we have here taught, how Gold, either alone, or with Antimony, may be brought over, the ſame may be ſaid of the Tinctures of Iron and Copper, which have ſurpaſſing Vertues in Phyſick as well as Alchimy.

We proceed now to ſhew how with our *Alcaheſt*, the Tinctures of Common and Precious Stones may be extracted to great advantage. It may be of good profit alſo from hard fix Stones, ſuch as Granates, which have too much Tincture, to extract part of the ſame, by which means of Granates, Rubies may be made, one ounce of which is more worth than 100 *l.* of dark Granates: which extracted Tincture of Granates may afterwards be made uſe of to exalt the colour of Pale Hyacinths, and other white Precious ſtones.

In a word, this art of extracting the colour from Granats, and introducing the ſame into other ſtones, is an excellent, profitable (I had almoſt ſaid Royal) art, which notwithſtanding is ſo little practis'd, by reaſon of the General negligence and ſlothfulneſs of men, undervaluing this excellent art of Fire, tho' more may be gain'd by it than by Merchandize or any handicraft whatſoever. Let him who is a lover of art, ſet upon the work, and try what God will ſend him. It is impoſſible to ſet down all particular circumſtances of the work ſo exactly, but that the unexperienced may after all miſtake. It ſufficeth me that I have faithfully pointed out the right way towards the Land of Promiſe, leaving the reſt to the deſirous and active Traveller.

Thus I have in ſhort words acquainted the Reader, with the way of extracting Tinctures out of Metals and Stones, by means of my New-found Infernal Fire, and that to very great and good purpoſes, both in Phyſick and Alchimy; and will now in favour of Chymical Phyſitians communicate an eaſy way of bringing the pureſt Souls and Tinctures of imperfect Metals, over the helm, with our fiery ſaline Spirit, for the effecting of wonders in both faculties. But before I proceed to the Practiſe of thoſe ſecrets, I ſuppoſe it will not be amiſs if I endeavour to place our *Sal-Armoniack* in a greater Light; for ſeeing by it, all muſt be performed, which is here ſpoken of, it will be needful to know what properly this word imports.

Of the Nature and Property of our New-found Griffons-Claws, *and* Eagles-Wings, *and what incredible things may thereby be performed in* Phyſick, Alchimy, *and other Arts.*

A Good *Sal-Armoniack* muſt have theſe following properties, *viz.* to diſſolve, extract, and to carry that which it hath extracted in diſtillation or ſublimation over with it; and the better it performs theſe, the better is it to be eſteemed. Now whereas common *Sal-Armoniack*, does only lay hold of, and carry over with it, the moſt volatile Sulphur of Vegetables, Animals and Minerals; our ſecret *Sal-Armoniack* does not only ſeize the light

only ſeize the light Sulphur, but alſo the ponderous *Mercury*, and therefore is far more to be eſteemed than the common. But my moſt ſecret natural *Sal-Armoniack*, extracts and carries over from all Metals and Stones their pure parts to admiration: and yet our *Griffons Talons* and *Eagles wings* are much more powerful, as not only ſeizing their prey with greater ſtrength, but alſo carrying it away with them more ſwiftly, and even ſuch pondrous things, which the foreſaid cannot elevate, or take away with them.

Moreover this New-found *Sal-Armoniack* carries over the ſaid Tinctures not coagulated in the form of *Sal-Armoniack*, but all Spirit, as being it ſelf no coagulate, but a ſpiritual *Sal-Armoniack*, and meer fiery Spirit, wherefore alſo it is able to perform ſuch great things. We will now proceed to the Practick part, and ſee whether there be ſuch a wonderful *Sal-Armoniack* in Nature which can perform all theſe ſtupendous effects.

A PROCESS,

To prepare the higheſt Medicine, or Univerſal Tincture for Humane and Metallick Bodies, by means of our fiery Alcaheſt.

Recipe, one or two pound more or leſs of clean Filings of Steel, ſuch as may be had of the Needlemakers, put them into a glaſs body, ſo as they may but take up a twelfth part of it; then pour upon them a well rectified Spirit of Wine, *viz.* to every pound of Filings four or ſix pound of Spirit of Wine. Care muſt be taken that the glaſs-body be capacious enough, elſe, when the Spirit of Wine begins to work on the Steel Filings, it will run over. The Body then being placed in Sand, and the Recipient ready at hand, add for each pound of Spirit of Wine in the Glaſs, one ounce of our *Alcaheſt*, which will acuate the ſpirit of Wine ſo, as to diſſolve the Steel, in which ſolution, the Sulphur of the Philoſophers, or pureſt Tincture of *Mars* is ſet looſe, and immediately received by the ſpirit of Wine, and with it carried up to the Philoſophick Heaven. But becauſe this Soul of *Mars* has not yet obtained to that height of purity which the Philoſopher deſires, therefore it muſt enter his Purgatory, there to put off all Impurities it has brought over with it: that is, the ſpirit of Wine muſt under a large refrigeratory head be burnt away, in which flame the *Anima*, *Mars*, or ſoul of Iron, becomes purified to the higheſt degree, the flame carrying the Tinging Medicine over in form of a pellucid clear Water, which is the true Water of life of the Philoſophers, healing all Curable Diſeaſes, if daily taken in a ſmall quantity. For this Medicine renews the Body of Man, and makes old Age young and blooming again; neither do I believe that a better Medicine can be found in the World than this is: and that becauſe the fix *Mars* with the help of our *Alcaheſt*, is brought to the higheſt degree of ſubtilty, and is afterwards by the pureſt of Fires, yet further purged and exalted. Wherefore alſo like Lightning it pierceth all parts of the Body, opens all Obſtructions, which are the cauſe of Death: And beſides all this, tinges *Lune*, and coagulates Common *Mercury* into fix *Sol*, as I have often tried and experimented my ſelf; for I ſhould be very loath now I am on my Death-Bed, and as it were dying, to expoſe any thing to the World, beſides what Experience has verified to me.

N. B. When firſt I made this Experiment, and was doubtfull as yet whether it would ſucceed or no, I prepared ſome pounds of Martial Spirit of Wine; and though I knew that from ſuch a ſpirit of Wine impregnated with *Mars*, little good could be expected, before the ſpirit of Wine were ſeparated from the Tincture; and that this ſeparation could not be made by any diſtillation or rectification, for that the ſpirit of Wine always carried the Tincture over with it, as Experience the Miſtreſs of Fools taught me: Therefore I caſt in my mind to burn away the ſpirit of Wine, which when I had done, I found all my ſpirit of Wine burnt away, and nothing remaining in the Porringer, only I perceived, that as far as the ſpirit of Wine had reached, it was tinged of a golden colour, higher than that of Ducat Gold. With which Experiment not being fully ſatisfied (though I ſaw that this way it was poſſible to make a true Tincture for Metals) I went further in my ſearch, that I might at laſt be Maſter of ſo great and profitable a Work. I diſpoſed therefore a great glaſs head ſo, as that conveniently I could under the ſame burn away a little diſh or cupfull of ſpirit of Wine, but the Glaſs-head ſoon broke with the flame of the ſpirit of Wine, which ſtill put me upon a further trial, I took a large, broad and deep Pewter diſh, placed it with the brim on three ſtones of an equall height, ſo that I could conveniently ſet under it a little cup with ſpirit of Wine: I filled my Pewter diſh with Water, and then kindled my ſpirit of Wine, to ſee whether any thing incumbuſtible would come over with the flame, and by that time I had burnt away about two or three ounces of Martial ſpirit of Wine, I found that the bottom of my diſh began to drop down a clear liquor, the Tincture of *Mars* and the incumbuſtible *Mercury* and Salt, together with the Phlegm remaining in the ſpirit of Wine, being all condenſed in the form of Common Water. After I had removed the Diſh, and poured out the Water, I found the bottom of the Diſh, the Cup in which the ſpirit of Wine was, and the Silver ſpoon I had ſet under the Diſh, to catch the Water dropping down from it, were all thick gilt.

Having perceiv'd all this, it was eaſie for me to infer, that for as much as Silver and Tin had been gilded thereby, that I was in the ready way of obtaining a true Univerſal Tincture for Men and Metals; wherefore I ceaſed not to contrive night and day, ſome convenient Inſtrument, for catching of the Tincture, aſcending in the flame of the ſpirit of Wine. And ſo at laſt after long ſearch, I had my deſire, being now confirm'd by Experience, that many pounds of ſpirit of Wine impregnate with Tincture, may in one days time be eaſily burnt away, under a Copper-tin'd Head, by which means the Souls, or incombuſtible Tinctures of Metals and Stones are obtained; which Head, or Refrigeratory Inſtrument, I intend (God willing) to communicate in the Sixth part of my Furnaces.

I can aſſure the Lovers of Art, that no eaſier or leſs chargable way can be found than this is, for to attain an Univerſal Medicine or Tincture, for that according to this Proceſs, an Univerſal Medicament may be had in three days time, and with very inconſiderable charges.

I ſhall add one or two Proceſſes more, to ſhew how by means of our fiery *Sal-Armoniack*, high and noble Tinctures may be extracted, out of other Metals and Stones, and ſhall begin with *Venus*.

Copper inwardly is very like Iron, and like it, is dignified with a very glorious Tincture, and by the help of our fiery *Alcaheſt* (proceeding as was ſaid

before of *Mars)* in three days time a true Tincture may be prepared from it for Men and Metals, thus: *Recipe* of the fineſt filings of *Venus*, one, two or three pounds, put them into a Glaſs-body, and for every pound of Filings pour on three or four pound of Alcolized ſpirit of Wine, lute the Helm and Recipient, diſtill in Sand, and the Alcoliſed ſpirit of Wine will diſſolve the *Venus*, vivifie her tinging Spirit, and carry it over the helm, yet not viſibly; but as ſoon as the ſpirit of Wine is kindled and burnt away under the refrigeratory, then the Tincture of *Venus* appears in the form of a deep red Salt: which Tincture performs whatſoever I have before attributed to the Tincture of *Mars*. And in the ſame way a fix Tincture may be had from common Combuſtible Sulphur in three days time, as here follows.

To fix the Common, Combuſtible, Yellow Sulphur in three days time into a red and fix tinging Stone.

THe whole Art of this Royal Work conſiſts only in uniting the ſaid Sulphur with ſpirit of Wine, and then burning it away under a helm; to catch the incombuſtible Heavenly Salt, or Water of Life permanent, which with Gold becomes coagulated and fixed to a Tinging Stone. Which heavenly Salt as ſoon as by the flame it is ſeparated from the Sulphur, is a true Univerſal Medicine againſt all the Diſeaſes of Mankind: but when joined with Gold, it obtains ingreſs and tingeth *Lune*, and coagulates *Mercury* into *Sol*. Now to unite Sulphur with ſpirit of Wine (wherein the whole Art and Maſtery conſiſts) without any Corroſive or *Alcali*, is an eaſie thing, and which I have declared in my late publiſh'd Writings, and therefore do not think it needful to repeat the ſame here. I do not deny, but ſince that time I have found nearer ways to the Buſh, but do not think my ſelf obliged to proſtitute thoſe Diſcoveries to all promiſcuouſly, it being well if I have not ſaid too much already, and told Tales out of the School.

As to the foregoing Operation, it is obvious to conceive that Common Sulphur joined with a dephlegmate ſpirit of Wine, burns much ſtronger, and conſequently with its flame will have a greater force to fix than a Common ſpirit of Wine can. We know that God in the beginning made the whole World of Fire and Water, from whence alſo all other things have their Original: For when Fire and Water, as contraries, work on one another, they always generate a third thing. The Fire, as the Agent, works upon its Patient Water, which action cannot be performed without the Air, nor can the Water without Earth have any Conſiſtence or ſtability to abide the Fires action. For which reaſon it is that we find no Metalline Oare, but only in the Earth, and eſpecially in ſuch Clefts and paſſages of the Rocks and Earth, where a conſtant moiſture trickles down, and whither the Central Fire can have free acceſs, to work upon its proper Patient: From which union of Male and Female Seeds, a third thing muſt neceſſarily be produced. Now if the Sulphur which is the Male, and the Water which is the Female-Seed, be pure, a pure birth proceeds from them, and by the rule of contraries if impure, the production muſt be ſo likewiſe. Thus it appears that the moiſt Caverns, Holes, and Clefts of the Earth, are the fitteſt Wombs for Minerals and Metals. I am not ignorant that Metals may alſo be generated in Sand or fat Earth, eſpecially where the ſame lye moiſt; for when the Demogorgon, or Central Fire, Spirit aſcends from the Center, and meets with a moiſt Sand or Clay, he joins with it, whence it is that oftentimes in Sand and Clay Metals are found, but not in great pieces as in the Clefts of the Earth, but only in leſs and greater Grains, according as the diſpoſition of the place permits, it being notorious that Grains of Metal are oft found in Sand, and waſh'd from it.

That the Subliming Sulphurous Vapor, when it meets with a ſlimy Matter in the Earth, doth unite with, and turns to a Metal, no Man needs doubt of: For I have ſeen many things in the Earth changed into Metalline Sulphurous Flint-ſtones. Thus we ſee that this Sulphurous Vapour readily cleaves to Snails in the Earth, turning them to Flint, of which I have ſeen many, and have ſome with me at preſent. Amongſt other things I have ſeen a Leather Purſe turn'd to Flint, as alſo the Privy Member of a Man, the reaſon of which will be obvious to him that conſiders of it. We know alſo that ſometimes though rarely Metals are produc'd in the Air, and from thence fall down to the Earth, eſpecially Iron in form of ſmall drops, becauſe the Air is not the proper place for the generation of Metals, for as much as they find no reſting place there. Stones alſo are at times generated in the Air, and from thence are caſt down upon the Earth. Thus in the Summer time, when the attracted Sulphur is kindled by the ſcorching beams of the *Sun*, and works on the moiſt Cloud, in a moment Stones are generated, which with Lightning are caſt down thence: Theſe are ſometimes of ſtrange Figures, but commonly are ſhaped like Wedges. I have ſeen one of them that was three-corner'd, and which way ſoever it was turn'd repreſented the figure of a Mans Heart, and had, amongſt other, this Virtue, that it preſerves all thoſe that are in the Houſe where it is, from being any whit terrified with Thunder or Lightning. But of theſe matters I have treated elſewhere, being only mention'd here to demonſtrate that Fire and Water are the Principles of all things; which being granted me, it will not be found ſtrange, that by burning away ſpirit of Wine, a Stone of the greateſt Virtue and Power, *viz.* that of the Philoſophers, ſhould be generated: which I have not only experimented my ſelf, but recommended it to others, who have likewiſe performed the ſame. Now if ſo weak a Fire, as that of Common ſpirit of Wine is, has the Power, by working upon its Patient, as it were, in a moment to generate an Heavenly Salt or Stone; why may not we then ſuppoſe, that when ſpirit of Wine by the union of a pure Sulphur, is made to burn much ſtronger; that this duplicate ſpirit of Wine, will produce a Duplicate *Mercury* or Cœleſtial *Salt?* Yea, ſurely it cannot be doubted but that ſuch a ſpirit of Wine acuated with the pure ſpirit of Sulphur, will not only in burning away afford a better *Mercury*, but alſo in greater quantity than any ſpirit of Wine alone can, becauſe the incombuſtible *Mercury* and *Salt* in *Sulphur*, becomes meliorated by the flame of the ſpirit of Wine, and highly exalted in Vertue.

When Sulphur is kindled under a Bell, or other convenient Inſtrument, the incombuſtible ſalt of the Sulphur, mounts with the flame, in the form of a Corroſive Oyl, and is caught and uſed to ſeveral purpoſes. But this ſowr Oyl, may well be compared to unripe Grapes, which being eaten, are hurtfull to the Stomach; but if theſe ſowr unripe Grapes be ſuffered to hang on the Vine till the heat of the *Sun* hath ripened them to a perfect Sweetneſs, then they will cauſe no gripings or flatuoſities, as unripe Grapes do, but afford good nouriſhment to the Body: and when

when the juice of them is by fermentation turn'd to pleaſant Wine, it not only ſtrengthens a weak Stomach, but revives the Spirits, comforts the Heart, ſtrengthens the Brain and all other parts of the Body, makes Men chearfull and courageous, and drives away Sorrow and Melancholly, and in a word, is a cauſe of much good to the ſick as well as ſound.

Now if Common Wine can do all this, what wonders, think we, may then be expected from the fix ſoul of its pureſt Spirit, when by its own proper Agents flames, it is in the higheſt degree purified, and beſides this, united with the ſweet ſoul of Sulphur, and thereby ſtrengthened in all its powers.

That Sulphur in its innermoſt is as good as Gold, none that are knowing in Nature will deny, but this doth not appear till by the flames of ſpirit of Wine it be reduc'd to a ſweet, pleaſant, fix, red tinging Salt, and then you are Maſter of as powerfull a Medicine, as any is in the World. *Lully*, tells us plainly, *Make that which is bitter, ſweet, and you will have the whole Art.* *Baſil Valentine* ſaith, That he who in the Chymical Art, can with ſpirit of Wine dulcifie a ſowre ſpirit of Salt, deſerves to be Knighted for it, as having done a moſt Heroical action; and adds, That with this dulcified ſpirit of Salt, the Tincture of *Sol* may be extracted, which is the very Truth. *Hermes* concludes his Smaragdine Table with theſe words: *Here ends what I had to ſay concerning the Solar Work*; and ſo ſay I too. I have ſpoke plain enough, and now catch who catch can: For I don't think my ſelf obliged not only to catch the Bird for others, but alſo to pluck, roaſt, chew and thruſt it into their mouths.

In like manner, as has been here ſaid of Sulphur, we may proceed with Antimony and Orpiment, for to obtain their Quinteſſences, as alſo with all Vegetables and Animals; with which pure Eſſences great wonders may be performed in Phyſick. Time will not ſuffer me to enlarge on the ſubject, but I intend (*God* willing) ſhortly to publiſh a ſmall Treatiſe of the *Divine Character*, or *Seal of the Deity*, by which the World and all that is in it was at firſt created, and yet daily the Stone of the Philoſophers and many other wonderful things are made, and brought forth a-new from the conjunction of Fire and Water, that is, *Sulphur* and *Mercury*; in which Writing, the true ground of many New Generations, which far ſurpaſs Nature, and are produced by a due combination of theſe two contraries, will be declar'd and laid open.

After the ſame Method, as before mention'd, the Tinctures of other red Metals, Minerals and Stones may be extracted. Only we are to take notice, that when we work upon Stones, 'tis beſt only to make uſe of our *Alcaheſt*, without the addition of ſpirit of Wine, for the obtaining of their Tinctures, becauſe ſtones are not of ſo eaſie ſolution as *Mars* and *Venus*. We may alſo with our fiery *Alcaheſt* extract red Tinctures from White Sand-ſtones and Flints, though not in ſuch quantity as from thoſe that are colour'd, which may eaſily be gueſs'd. Many, 'tis like, will wonder to hear that a red colour may be extracted from white ſtones; but this difficulty will be removed if they conſider, that all Sand-ſtones and Flints are nothing elſe, but an Earthly groſs Sulphur without any *Mercury*. Now we know that Sulphur is a Father of all Metals, and that when *Mercury* and *Salt* in a due proportion is join'd with him, then he makes a Metal. We alſo know that all Sulphur inwardly is red, though it do not appear ſo outwardly till it be joined with Salts. We have an inſtance of this in Lead, in which no redneſs appears at all, but when the ſame is calcined with Salt, its blackneſs is turn'd to a lively red, as may be ſeen in Red Lead. For Fire and Salt have the power to exalt all Sulphurs. Foraſmuch then as the White Flint or Cryſtal has Sulphur in it, as appears from their giving forth ſparks of Fire, when they are ſtruck hard together, in like manner as when they are ſtruck with Steel, which is nothing elſe but a fix Sulphur, that by its proper Agent, which is naturally in it, *viz.* a Vitriolate Salt, with the aid only of outward Fire, may be ripened into a True Tincture. And here I refer my *Reader* to what *Artephius* and *Pontanus* writes concerning their ſecret Fire, for further ſatisfaction.

I have prepared a particular Tincture from a white Sulphur, whereof one part tinged three or four parts of red *Venus* into *Lune*; but when I commit this white Sulphur for ſome time to the Fire, its whiteneſs becomes by degrees changed to redneſs, which then being projected on Copper, gives it the colour of Gold. And if the Tincture be wholly fix, it turns the *Venus* throughout to fix *Sol*, but if it be not yet fix, it can never make fix *Sol*, though it have attained a red colour in the Fire. Foraſmuch then as white Flints are nothing elſe but Sulphur, why may not our Helliſh Fire Spirit be ſuppoſed able to make the ſame Red, as well as the White Metalline Sulphur. I declare it therefore as a certain truth, that all white Sulphurs by means of Salt may be made fix and red; and he who is ſo far advanced in the knowledge of Nature and Art, as to know how to apply to every Agent its proper Patient, will eaſily obtain his deſires without any extraordinary charge or trouble, and in a ſhort time, for without the joining Actives with Paſſives underſtandingly in weight and meaſure, no good can be done.

A PROCESS.

To Extract a Red Tincture out of all White Flints, and bring it over the Helm by means of our Fire Spirit, and afterwards to fix the ſame.

Recipe one, two, or three pounds of finely powdred White Flints, and pour upon them half as much of our Helliſh-fire-ſpirit, abſtract the ſame in Sand by retort, and it will carry the pureſt ſulphur of the Flints over with it, which may afterwards be fixed with our Catholick Coagulator. And if inſtead of Flints you take a Gold Spar, which beſides ſome fix Gold, contains much that is Volatile, your pains will be better beſtowed. And in caſe you cannot get any of theſe, then take the *Terra Sigillata*, or ſealed Earth of *Sileſia*, in which much volatile Gold is hid; but if you can get the Red Turkiſh *Terra Sigillata* of *Lemnos*, you will have a much richer Tincture, as abounding with a greater quantity of Spiritual Gold, than any of the forementioned. But take heed you be not deceived, for much of that which is ſold for *Terra Sigillata* of *Lemnos*, is nothing elſe but *Bolus Armenus*.

Ovid and others have in their Fables made mention of this Earth, which is ſo rich in Gold under the name of *Vulcan*, whom his Mother after ſhe had brought him forth in Heaven, finding him to be deformed, flung down to the Iſland *Lemnos*, where ſome Apes, that is Philoſophers, who imitate Nature, took and waſhed him, that is, by their fiery Water, took away his ugly and deformed outſide, ſeparating the pure Tincture from the groſs Body, as I have here taught.

The

The Curious who desire to know more of these matters, let them read the experienced and ingenious *Brucescus* his Book of the Tree of Life, who will give them full satisfaction. But if none of all these forementioned can be had, we may make use of Blood-stone, Ruddle, or any other Red Earth that abounds with volatile Gold, of which there is great plenty in most parts of *Germany*. The Red Jasper-stone, Granates, and Yellow Jacinths do also much abound with Tincture. But these and other such-like, I leave to others to find out, for it is impossible for me to mention all. I conclude this little Treatise with this Solemn Affirmation, that it is a very easie thing in a short time, and without any charges, to speak of, to prepare fix Tinctures, from common Metals and Stones. Believe and set upon the Work, and thou wilt find it so indeed.

The End of the Seventh Part.

LIBELLUS IGNIUM,

OR,

Book of FIRES.

In which is Treated of strange and hitherto unknown *FIRES*, to what end they serve, and what great Profit may by them accrue to Mankind.

Translated out of the *High-Dutch*.

Beloved READER,

THat which hath moved me to write this small Treatise of Secret Fires, *with their great Operations, hath been only this,* viz. *Because* God Almighty *hath commanded us not to hide our Talent in the Earth, (like the Unprofitable Servant) but to improve it to the glory of* God, *and the good of our Neighbour. To improve and augment it, as we may see in the* 16. *Chap. of St.* Luke. *Seeing therefore that the most merciful* God, *hath revealed those high Secrets to me, in this my great Age, makes me judge that such great gifts of* God, *have not been discovered for my sake only, who by reason of my great Age have, as it were one foot already in the Grave; but that I might make known such wonderfull Works to the World.*

Of the first Fire, and its Profitable use.

HOw to make a Lamp, which being closed up in a Glass, may be made to burn continually by its own vertue, and give light without any other help.

Of the benefit of this Lamp.

SUch a Lamp may serve all those who love to see light, as the Image of *God*; and may also be very available to those who by reason of continual Weakness are forced to lie much upon their Beds; which they may keep continually burning in their Bed-Chamber, not only because of its clear shining light, which doth neither smoak nor scent, like all other Combustible Lights, which scent is very prejudicial not only to the Sick, but also to the Healthy, because such smoaks offend the Heart and Brain. On the contrary, this Royal Fire is pleasant, strengthening, and refreshing to the Heart and Brain, and its Cotton or Wick is made of incombustible matter, and casts a sweet flavour all over the Room. This secret Fire might also serve the Hermetick Physicians to prepare a Universal Medicine; especially if the sweet refreshing Odour, which proceeds from it in Burning, be received in a Philosophick Receiver, and administred to their Patients, as a great Cordial, renovating, and restorative Medicine.

Although this secret Fire, be of far greater advantage

tage than what hath been mentioned, yet for certain reaſons its further uſe muſt be concealed. This Fire is appropriated to the Elemental Air, ſeeing it hath its own Air in it ſelf, by reaſon of which it burneth in a Glaſs well cloſed, and if touched by the leaſt Air, it extinguiſheth and goeth out, of which you may ſee more in the Fifth Part of my *Pharmacopœa Spagyrica*.

There is another unknown Fire, which is appropriated to the Earth, becauſe it reſembleth a black Earth, and being ſhut up in a cloſe Veſſel of Glaſs, will keep its Fire perhaps to the end of the World, provided there cometh no Air into the Veſſel; but if one would have it a viſible Fire, the Glaſs muſt be broken that the Air may come to it, ſo the matter will preſently enkindle it ſelf by the Air, and in a ſhort time burneth to a coal, yet without flame or ſmoak, and at length is conſumed, and leaves heavy Aſhes behind.

Of the Uſe of this Earthy Fire.

ALthough it may ſeem to many, that this Fire is not fit for any thing, yet I affirm it to be fit for great and weighty matters, which are not fit to mention, much leſs to make known, by reaſon of the abuſe which may be made of it; this Fire being ten times more forcible than Gun-powder. Moreover, it alſo plays its part in the Melioration of Metals, for when this black Earth-fire is fluxed in a Crucible, then poured out, and expoſed to the Air, it begins to move, and grow as it were living, ſo that one may ſee how, forcibly it attracteth the Air, fills it ſelf with puffing Bladders like an incenſed Toad, continuing ſuch a motion for the ſpace of three or four days, then the matter falleth aſunder, and there floweth out of it a red firey juice, the remainder is dead and unprofitable.

With this red juice, wonderfull things are to be done in Alchymy, not neceſſary to be mentioned in this place, becauſe it is my deſire onely to make known the Wonders of God. But he that will know more of it, let him read the Fifth Part of my *Pharmacopœa Spagyrica*, treating of the Stone of the Wiſe, where he will find how the blood of this Toad doth in few hours draw the Colour of Gold, ſo that the Body remains white, therefore it may be ſuppoſed to be the Chalybs of *Sendivogius*.

This Fire is alſo made of Steel, for when it is touched with a wet finger, ſparks fly from it, as from a red-hot Iron which a Smith is forging upon an Anvil. But enough at this time of this wonderfull Earth-fire till another opportunity. *Ripley* ſeems to have known this Fire, and of it to have prepared his Univerſal Tincture: his Dream ſounds thus, I have ſeen a red Toad drink ſo much and ſo long of the juice of the Grape, till his inwards did burſt aſunder, *&c.*

The third Secret Fire is appropriated to the Elementary water, becauſe it ſofteneth and diſſolveth all hard Subjects; it alſo radically joyneth the different nature of Metals, into wonderfull tinging Stones. Seeing that this Water-fire is of great vertue to the Metals, both particularly and univerſally, I am reſolved (for brevity ſake) to make known its vertue in a few caſes, the reſt will be known by the diligent. Firſt, this wet Fire hath ſuch great vertue, that it can diſſolve radically the moſt fixed Gold, within the ſpace of twelve hours, as alſo to unite it with *Lune*, to volatiliſe and render it irreducible. Which volatile *Sol* and *Lune* is no more like unto *Sol* and *Lune*, but in colour, eaſie flux, form and weight, appeareth like unto black *Saturn*; therefore the ancient Philoſophers, becauſe of its form and ſimilitude, have called it the black Lead of the Wiſe, and becauſe of its volatility the *Mercury* of Philoſophers; which *Mercury* or black Lead of the Wiſe may be alſo *per ſe*, brought into a true Tincture.

Therefore they have all erred, who have taken *Antimony* for the true black Lead of the Wiſe. He that will know my failings in this matter, let him read the Third Part of my *Pharmacopœa Spagyrica*, where he will find Wonders, eſpecially how I have cleanſed it to the higheſt degree, and concentrated it into a white Mercurial fuſible Stone, which doth ſhew ſuch vertues in Medicine as are to be admired. This white Stone hath ſuch vertue, that it cureth all diſeaſes, if it be held every morning onely a while in the mouth; of which I have treated more clearly in the Fifth Part of my *Pharmacopœa Spagyrica*. This true black Lead, which by this humid Fire, is made of Common *Sol* and *Lune*, hath no equality with *Antimony* nor other common Lead.

What elſe is to be done in the particular Melioration of Metals, doth not belong to this place, but ſhall, by the help of God, be declared elſewhere.

This moiſt Fire hath power to extract all *Sol* and *Venus* out of *Lune*, in few hours, if the *Lune* be firſt granulated, and then put into it, without diſſolving the *Lune*, ſo that the *Lune* remaineth almoſt as fine as from the Teſt. The extracted *Sol* and *Venus* may eaſily be ſeparated from the Water, each by it ſelf, by precipitation, inſomuch that the Water retains its vertue, and there is no loſs either of the *Sol*, *Lune*, or *Venus*. In like manner the allay of *Sol* and *Lune*, by *Venus*, may be extracted with eaſe, in great plenty, and for little charge. Which Secret would be of great uſe to Refiners, or ſuch as have much Gold and Silver to be parted, as in Mines, *&c.*

It is ſufficiently known what great labour and charge is required by the common way of parting Gold, and Silver, and Copper, *&c.* therefore needeth not to be repeated.

Here followeth a ſhorter and eaſier way.

FIrſt, if my impure Gold be in great lumps, I granulate it; but if it be Jewels, Rings, or Chains, I onely neal them, and therewith fill a parting glaſs to the third part, then I pour thereon of my cheap and new-invented *Menſtruum*, ſo much as may ſwim above it a fingers breadth, put a Limbick upon it and ſet it in a Sand-furnace, give fire by degrees till the Liquor boil, and be all gone over the Helm, to a dry Salt. So hath the *Aqua Fortis* in the time of digeſting drawn to it ſelf all the allay of *Lune*, *Venus*, or other impurity, out of the Gold, in form of a green Powder, which remains with the Gold in the Glaſs. When it is cold, I take it out of the Sand, and put in warm Salt water, to diſſolve the extracted *Lune* and *Venus*, that it may be poured out of the Glaſs: which done, I boil it in a Copper Kettle, ſo the Salt-water extracts the *Lune* and *Venus* from the *Sol*, and maketh it fine. I decant the green and thick water from the *Sol*, and put to it in the Kettle freſh Salt-water, and boil it to extract the reſt of the *Lune* and *Venus* from the *Sol*. But if this ſecond Water ſhould yet be green and thick, that is a ſign that there yet

remains more *Lune* and *Venus* with the *Sol*; therefore more freſh Salt-water is to be added to the *Sol*, as before. After boiling, put all the green Waters together, and at laſt pour upon the Gold onely common ſweet water, with which boil the Gold to extract the remaining ſaltneſs from it, which will leave it fine and ſhining in the Kettle, as fine Gold uſeth to be, which is to be ſet upon a ſmall fire to dry, then to be kept as fine Gold. The green Water is to be filtred, ſo the *Lune* will remain behind in the filter, which is to be dried, and mixed with the common fluxing Powder of *Sulphur* and *Nitre*, and being melted will be reduced to the fineſt *Lune*. Boil the green filtred Water in an Iron Pot, ſo all the *Venus* will ſettle to the Pot bottom, which is to be edulcorated with Water, and being mixed with the above-named fluxing Powder, and reduced becometh the fineſt *Venus* that can be ſeen with eyes. By this means I doe not onely find all my *Sol*, *Lune*, and *Venus*, but alſo an increaſe of the *Sol*, the reaſon of which increaſe proceeds from my *Aqua Fortis*, which is a graduating Water, and of a meliorating nature and property: which encreaſe indeed is not over-great, yet it pays for all the charge of Coals and Labour. This work may be performed in the ſpace of twelve hours without any loſs of *Sol* or *Lune*; which differs greatly from the tedious vulgar way of ſeparation, which is very laborious and coſtly, beſides the great loſs of the *Sol* and *Lune*. So that ten Marks may be eaſier ſeparated by my way, than one Mark by the common way.

One great Secret more, above others, which for brevity ſake cannot be all inſerted here, is this. It is well known to all Chymiſts, that all Vegetables, as alſo Animals, by addition of common Water, may be brought to fermentation, and according to every ſubject, a *Spiritus Ardens*, of great uſe in Phyſick, may be diſtilled. But how to make ſuch a ſubtile Spirit out of Metals, I never read in any Authour, nor heard of. But I have found out a way by which great matters may be done, which cannot be mentioned here, let others ſearch after it as I have done, it is not good to caſt Pearls before Swine. Yet that the deſirous may know ſomewhat of an Artificial Metallick Fermentation; I ſay that out of certain Salts a Water may be prepared, which when it is put upon a compact Metal, that the ſame by a certain property in the Water, begins to ſwell up and ferment, like to the fermentation of Wine, Beer, or other vegetable Drinks; and after fermentation, by diſtilling in Balneo yields an exceeding ſubtile penetrating Spirit, ſtrong, ſweet, and volatile, according to the nature and property of the Metal; which may alſo by rectification be concentrated and ſubtilized, like that which is drawn from Wine or other Vegetables, without any Corroſion; ſo that ſuch a Spirit may be put into the eye without the leaſt hurt, or ſence of ſharpneſs. [See the Sixth Part of the *Pharmacopœa Spagyrica*.] Therefore it may eaſily be concluded, that ſuch a Metallick Spirit may effectually be uſed in the moſt difficult diſeaſes. But thoſe Spirits are not onely highly profitable in Medicine, but cannot alſo fail to ſhew their effects upon Metals; for I have already experienced thus much, that the Spirit of *Sol* doth in few days graduate Common *Mercury* into *Sol*, in like manner doth the Spirit of *Lune* and *Jupiter* graduate *Mercury* into *Lune*; other Spirits of Metals I have not yet tried. And although many may think to force ſuch a Spirit out of Metals as is drawn out of Vitriol, yet they err, becauſe every Vitriol diſtilled *per ſe* beſides the Phlegm, acid Spirit, and heavy Oil, yields alſo a volatile Spirit, which may be very much ſubtilized by rectification, but it hath no compariſon at all, nor likeneſs with my new-invented volatile humid Spirit of Metals; becauſe the above mentioned volatile Spirit of Vitriol, conſiſteth onely of a ſubtile ſalt Spirit and ſpiritual Sulphur, which may ſufficiently be demonſtrated. For when ſuch a ſubtile ſalt Spirit of Vitriol ſtands a while in a Glaſs cloſe ſtopped, the volatile Sulphur of the Vitriol ſublimeth it ſelf to the top of the Glaſs, and congeals it ſelf in the form of common yellow Sulphur, and the humidity remains in the Glaſs like an inſipid Water, without ſmell or taſt. Therefore the volatile Spirit of Vitriol now-a days prepared, is to be eſteemed for nothing elſe but a volatile Spirit of Sulphur. In oppoſition to which my Metallick Spirits, eſpecially thoſe of *Sol* or *Lune* have no combuſtible matter in them. Alſo the Spirit of Vitriol is yet corroſive, which the Metallick Spirits are not. Therefore let no man think that my invented Spirits of Metals are of the ſame nature with the ſulphureous Spirit of Vitriol, Allom, or common Salt, or the like, but let it be eſteemed as a new-invented high Secret, the like of which was never yet known to the World. He to whom God ſhall pleaſe to reveal how theſe Spirits of Metals may again be brought into fixed bodies, ſuch a one may well eſteem himſelf happy. Seeing that ſuch a Spirit being yet fugitive, can mortifie running *Mercury*, and tranſmute it into *Sol*. Alſo know, that our ſecret Salt water hath power to bring other Subjects into fermentation: As for example; if I was willing to bring Tartar again into fermentation, to try what Spirit it would yield, I diſſolve it onely in fair water, and put to it a little of our Univerſal ferment, ſo will the Tartar preſently begin to ferment and work, and yields a wonderfull volatile Spirit, which is not to be had by any other way. Here I will add onely one thing by way of hiſtory; namely, what happened unto me once, when I joined a little of this ferment with ſome Urine: that the ſame did preſently begin to ferment, and yielded a moſt dreadfull ſcent, ſo that I was neceſſitated to carry the Urine out of the room, the ſmell was ſo offenſive, that it enfeebled my Heart and Brain; and in the diſtilling, yielded a ſcent far worſe than the putrefying of any dead carcaſſes of beaſts, at laſt I forced over all the unpleaſant Phlegm, took the *Caput mort.* out of the Glaſs, and diſtilled out of it a ſtrong Corroſive Spirit, with which I did diſſolve *Sol* and *Lune*. But what is further to be expected from it, time will ſhew me. There came alſo with the ſtrong ſalt Spirit, a red Oil of Urine, not ſtrong.

To enlighten the former diſcourſe, there remains yet ſomething to be ſaid, namely this: That the before mentioned Spirit of Metals may be handled in all reſpects like the burning Spirit of Vegetables, which is diſtilled from Vegetables fermented; in rectifying, the moſt ſubtile Spirit cometh over firſt, and the unprofitable Phlegm remains behind; and the oftener this rectification is performed, it is the more pure, ſubtile, ſtrong and pleaſant, ſo that the vertues of all other Vegetables, ſome of this Spirit being poured upon them and digeſted, may be extracted, and ſeparated from their groſs feces, by ſeparating the Spirit of Wine in Balneo, ſo the vertue of the Herb, Root, or Flower, will remain in the Glaſs; of which one onely drop hath more vertue in Medicine, than a whole handfull of the herb from which it was extracted; yet the Spirit remains good, and is always

proper

proper for the like occaſions. But if one deſireth no Extract, but onely a Spirit of Vegetables, ſtrong and forcible in its operation, then muſt the Spirit be put upon freſh well-ſcented cordial Herbs, Roots, Flowers or Fruits, digeſting them together, then abſtracting the Spirit again, ſo will it be much ſtronger, ſubtiller, and of a more refreſhing ſmell than before. Thus in like manner can we doe with our Spirit of Metals, and make it as ſtrong as we will, by putting the ſame upon freſh Metals, and letting them ferment together, then abſtracting, and ſo fermenting and abſtracting, whereby it always grows ſtronger and ſtronger, ſo that afterwards greater things may be done with it both in Medicine and Alchymy. If then the ſimple Spirit of Metals doth wonders in Medicine and Alchymy, what will not this doe, that hath three or four times its ſtrength? Conſider of it, enough to the wiſe. The Spirit of Metals thus made we eſteem for the true *Aqua vitæ* or *Vinum ſalutis* of the Ancients, and no other made of Vegetables. Take notice alſo by the way, that our Ferment doth not loſe its vertue in diſtilling, but ſerveth always for the like Works, to wit, the Fermentation of Metals.

Seeing that our Ferment is a volatile Salt, after Fermentation the ſubtile Spirit is abſtracted, and the Phlegm received by it ſelf, ſo at laſt riſeth our Ferment with a ſtronger Fire, and leaves the mortified Metal as unprofitable feces. So that the Ferment being once had, it may be often uſed, yet it is ſomewhat diminiſhed every time by ſticking to the glaſſes, yet not being coſtly, the loſs may be eaſily born, ſo that there needs never be no want of it. This is indeed a wonderfull ſubtile metallick Wine, of which I had once a Viſion about thirty years ago (with theſe words: *Ex fece, de fece, debes carpere vinum tuum,*) yet I knew not the ſignification to this time. I have had much thoughtfulneſs about it, yet all in vain, untill God was lately pleaſed to ſhew me the way of preparing ſuch Wine.

If I ſhould write all things which may be done with my new-invented Fermentation out of Vegetables, Animals and Metals, I ſhould have work enough for a great Volume, and as it were bring forth a new World: but let this ſuffice at this time.

Next followeth the fourth Secret Fire of the Wiſe, to perfect an Univerſal Medicine both for Men and Metals.

THat the ancient Philoſophers did make their Univerſal Medicine, not out of one Subject onely, is clearly to be ſeen out of their Writings. And as their Subject was divers, ſo have they alſo uſed ſeveral Fires to decoct their Subject; for ſome Subjects, as fixed *Sol* and *Lune*, they have made volatile by their humid Fire, and again made the volatile fixed by means of the known fire of Wood and Coals. Therefore have they ſo poſitively affirmed, that without common Gold and Silver, no true Medicine for the Metals can be made. And this, by reaſon that other Subjects were yet unknown to them; and they knowing no better, thought theirs to be the onely way by which the Univerſal Medicine could be made. But others have wholly rejected *Sol* and *Lune*, ſaying they are dead, and that one ſhould beware of them; but that their *Sol* and *Lune* were living, and that no commonly known fire could ripen them, that a far other fire is required for that purpoſe; theſe and the like contrary Writings (although they are both true) have confounded the Searchers, ſo that one eſteemeth one Writer, and another, another, and yet are always doubtfull after which Authour they ſhould work. *Pontanus* confeſſeth that he erred two hundred times, although he wrought in the true matter, and ſhould never have underſtood if he had not read the old Philoſopher *Artephius*, and of him learnt the Secret Fire. He deſcribes alſo the Secret Fire in the ſame manner, which *Artephius* doth, to wit, thus: *Our Fire is no Common Fire, it is Artificial to find out, it diſſolves, deſtroys and penetrates all things; it is equal, continual, and conſtant, burning with our Glaſs, and not without*, &c. Our Subject is alſo no common *Sol* or *Lune*, but as yet an unripe Mineral, on which Nature hath but began to operate. All they who have wrought in ſuch unripe *Sol* and *Lune* have alſo of neceſſity known this Secret Fire, or elſe they have failed, and could accompliſh nothing. Some have known the volatile Gold, as alſo the Fire belonging to it, and yet could not come to work with it; the reaſon was, becauſe they as yet wanted the inſtrument belonging to it, becauſe if a volatile matter be to be ripened in an open Glaſs with a flaming fire, it is impoſſible but that the volatile *Mercury* ſhould fly away; and if a Receiver were applied to receive the volatile Spirit, then by that means the Fire would be ſtifled and go out. Here is good counſel at a dear rate, but the diſcovery of the ſecret Veſſel maketh all cheap again; for without the knowledge of this Veſſel, little is to be done. Is it to be an Univerſal Work, ſo muſt it alſo agree with the Univerſal Work of this world? We ſee daily how that the warm Sun cauſing its beams to deſcend downwards upon the Globe of the Earth, cauſeth all Vegitables to grow and multiply, and not onely Vegetables, but alſo Animals and Minerals, as *Plato* witneſſeth in theſe words: *The Sun and Man generate Man.* So that the oftener the beams of the Sun doth draw up the moiſture of the Earth, and let it fall down again in Rain, by ſo much the more it maketh the dry Earth fruitfull, by which means the Fruits of the Earth ſprout forth faſter, ripen, and multiply; becauſe the moiſture when drawn up in the daytime by the Sun-beams, always leaveth behind it its fruitfull Salt, which it had attracted from the Air, in the bowels of the Earth, and is ſtill again impregnated with the influences of the Heavens; for without the Air, nothing can live, encreaſe, or multiply, the which *Hermes Triſmegiſtus* hath very well given to underſtand, when he ſaith all which is above, is alſo below, by which wonderfull things are brought forth; the Sun is its Father, the Moon its Mother, the Wind carrieth it in its belly, the Earth hath conceived it and brought it forth, and is its nurſe, by continual aſcending and deſcending it hath obtained its force, and its vertue is compleat, when it is tranſchanged into Earth, *&c.* Here *Hermes* gives ſufficiently to underſtand, that the volatile matter of the Stone is elevated from the bottom of the Veſſel to the middle region of the Air, and muſt again deſcend to the Earth, that by its continual aſcending and deſcending it may be made to live and encreaſe, as it is in the great World. But how to make this aſcention and deſcention as it is and ought to be done in the Philſophick work, is not permitted

ted to be divulged: but it is more than enough to diſcover and aſſure that in ſuch a ſecret Furnace and hidden Fire, the volatile Gold of the Wiſe may be ripened into a living Medicine. *Amen.*

[Here ſhould come in a ſmall Treatiſe, entituled, *The Explication of* Solomon's *Words*: Viz.

IN Words, Herbs and Stones, there is great vertue. *But who this* Solomon *was, is altogether uncertain; and the Treatiſe it ſelf conſiſting of nothing but fabulous Stories of divers Events, which followed upon the ſpeaking of certain words at divers times, and upon divers occaſions, and containing nothing (as I conceive) that will be uſefull either for a Chriſtian, or an Artiſt, I think fit to leave it out; and more eſpecially, becauſe this Treatiſe is wholly foreign to the Authour's knowledge and experience, but taken upon truſt (as to matter of fact) at random, and from others, which is diſagreeable from all the other Writings of the Authour. All that I think worth the Tranſlating is ſomewhat relating to the Colouring of Glaſs; which take as follows.*

With one pound of pure Glaſs, mix about a dram of the Aſhes of Copper, [or *Crocus Veneris*] and melt them together in a ſtrong Fire, and you'll find a green Glaſs, reſembling the *Onyx-ſtone*. In like manner alſo a whole pound of Glaſs is made like to the faireſt *Saphire*, if a dram of *Cobolt* or *Biſmuth*, melted, be added to the *Scoriæ* or Droſs. Likewiſe one dram of the Ruſt of Iron changeth a whole pound of Glaſs into a yellow Stone, emulating an *Hyacinth*. If one ſhall melt a dram of the Tincture of Gold, or of the Philoſophers Mercury, extracted from Gold and Silver, with a pound of Glaſs, that Glaſs becometh very red, like a *Ruby* in colour, as I my ſelf have found. But if any ſhall be ſo fortunate as to make this Glaſs hard, as well as of a beautifull colour, he will need to take but little pains for his living.

(*There is a ſhort Diſcourſe adjoyned to this, called,* The Quinteſſence of Metals; *but whatſoever is mentioned in that, is contained in the Fifth Part of the* Pharmacopœa Spagyrica, Book of Fires, Book of Dialogues, *&c.*]

The End of the Second Part.

THE THIRD PART OF Glauber's WORKS.

A TREATISE OF THE Three Principles of Metals,

VIZ.

The Sulphur, Mercury, and Salt of Philosophers;

HOW,

They may profitably be used in *Medicine*, *Alchymy*, and other Arts.

Of SULPHUR.

That Sulphur *is one of the Principal Columns of Medicine, and also a Primary Part of the Three Principles of Metals, is more than sufficiently manifest; also, that in it is reconded much good, several Books left unto us (published by Ancient and Modern Authors) do clearly witness. But those Books, for the most part, all of them are obscurely written, and every notable and most remarkable thing is by them both concealed and manifested. Hence it was most usual, of it to prepare certain Vulgar Medicaments; as,* Yellow Flowers, *a* White Magistery, *a* Red Balsom, *and an* Acid Oyl per Campan. &c. *But among all other,* Paracelsus *in Writing hath most clearly unveiled the same; yet so warily, as few could perform the like, although many diligently searched.*

Therefore, since the Writings of this most highly illuminated Man are able to give a good Testimony of Truth to this my Work, I thought it very convenient, to insert a part of the best of his Writings in this small Treatise of mine; whence it will appear, how our Art is carried on and Augmented Yearly. The Words of Paracelsus *are these which follow.*

Of SULPHUR.

GOD hath created *Bitumen*, endued with many rare and admirable Virtues, not only conducent for the necessary use of a *Physician*, willing and ready to heal the *Sick*, but also for the vast Phantasy and Operation of Chymistry. Besides, in it are many other Virtues, which wonderfully discover themselves by *Sulphur*, because it is the true *Bitumen*. Wherefore I thought it worth my while, not only to describe the Medicinal Virtues of *Sulphur*, but also the Chymical, and many other associated Virtues of the same, in every other Profession and Business.

It is to be owned, that many things have been writ of *Sulphur*; but the true Foundation of the true Virtues thereof, hath scarcely yet by any Man been exactly enough touched or proposed. But those Writers are to be blamed, who would describe all things, of which they have no Understanding; because, in so

doing, they did indeed compoſe and preſcribe ſomewhat; but nothing fundamentally, or according to its genuine Diſpoſition and Property, as in Writing and Deſcribing is requiſite. For in truth, they themſelves underſtood not, yet (through their ambitious Haughtineſs) they would compoſe Books, conſiſting of Letters only, without Soul or Spirit. But I, as One experienced, preſent you my Experience of *Sulphur* in all things, *viz.* What *Sulphur* is with reſpect to *Medicine*, *Alchymy*, and all other aſſociated Artifices. Therefore know ye, that in *Sulphur* (but it is in GOD only to hinder) are wonderful, and thoſe ſo admirably famous, Things, as thence the natural Light of Man may derive Cauſe enough for Wonder: Or elſe, (if GOD prohibit not) the Fault is in the Artiſt's handling it; which is a thing very probable. For, when every babling Sophiſter thinks himſelf a Phyſician, and every Finical Fellow will be accounted a Chymiſt; then it comes to paſs, that Arts can never be rightly expoſed to publick view. But howſoever the Matter is, the Foundation lyes here: In *Sulphur* (for either Faculty) are inſited ſo great *Arcanums* and Powers, as almoſt no Man can throughly exhauſt them; and alſo ſo great Virtues, as will cauſe admiration in every Man. For in very deed, according to the Experience of all Men, (in either Faculty) there are ſo many things worthy of Note; becauſe in *Sulphur* is ſuch an Efficacy, as few like unto it are given, nor in *Chymiſtry* and *Medicine* can its ſecond be found. Yet *Ariſtotle* defames that, ſaying, *Tranſmutation of Species cannot be.* But *Sulphur* ſuffers Tranſmutation: Which is ſufficient to prove, that *Ariſtotle* (if he were now living) might be convinced of his Folly, even by Women.

No Phyſician or Chymiſt ſhould convert Sulphur to his Uſes, according as it is found in it ſelf; but ſeparated into its *Arcanum*, and purely freed and cleanſed from all Impurities, until it is ſo purely clean, as its Virtue exceeds the whiteneſs of Snow. *Hyſſopus*, that is, the *Art of Separating*, doth this; it was anciently called *Hyſſopaica*, in Alchymy and every Separation. Yet Sulphur is of admirable uſe for its vulgar Buſineſſes, or common Artifices. Now, that I may more accurately explain ♃ to your Comprehenſion, I will firſt diſtinguiſh it according to its Nature. For it is not produced from one *Matrix*, but from many. Wherefore alſo, it acquires divers Operations, that is, hath in it ſelf various affections, not one diſpoſition only, but peculiar peculiarly. And that the Phyſician may not err, I will here preſent to him the Nature of that Sulphur, which is beſt for his uſe in Medicine; alſo to the Chymiſt, I will exhibit the diſpoſition of that, which is profitable in Alchymy; and laſtly, I will ſhew, how far it is conducent for every common Buſineſs. Therefore the Inſtruction being firſt premiſed, its uſe ſhall be ſuperadded, not only in Medicine and Alchymy, but alſo in other common Vocations; that every Man in his own Operation may know, how to uſe and apply the ſame, without miſtake or Error.

Touching the *Embryonate Sulphur* of Metals, *viz.* what is inviſibly contained in it, thus take it: That ♃ in Diſeaſes doth ſo admirably conſerve and reſtore its own Member, as it manifeſts the Members to ſtand in need of a Mineral Medicament only, and no other. Hence the ♃ of ☉ is conducent for the *Heart*, of ☽ for the *Brain*, of ☿ for the *Reins*, of ♄ for the *Spleen*, of ♂ for the *Gall*, of ♃ for the *Liver*, and ♀ for the *Lungs*.

Alſo there is found a kind of *Embryonate Sulphur* in Wood: But that ♃ is Fire only, which no Man can preſerve in its Life and Eſſence otherwiſe than in the Wood, with which it paſſeth away, and dyes. Such is the ♃ of all things which are Woody, or whatſoever it be, that is plainly reduced by Fire into Aſhes. This ♃ is Vegetable, but not fixed; nor is it conducible for any thing at all, except thoſe things, which are to be prepared by Fire. Now be it known to you all, that that ♃ indicates the Virtues of other Sulphurs, this way: As Fire devoureth all things, ſo every ♃ is an inviſible Fire, which doth inviſibly abſume Diſeaſes ſo, as Fire viſibly conſumes Wood. Wherefore the *Element* of *Fire* is a ſingular *Arcanum* in all Diſeaſes. He that wants this Element of Fire among his Secret Medicines, ought not in any wiſe aſcribe to himſelf the Name of a *Phyſician*; nor can he ſhew himſelf an Expert Phyſician, but is rather an Erroneous Operator, and a Robber of the Sick. Further I ſay, ♃ is the *Element* of *Fire*, and if any one would have it exerciſe the faculties of a Medicine, let him take care to volatilize it ſo, as it may vaniſh like a Flame; that is, let it be ſo ſubtilized, as it may recede from its own Body, and the Body be ſeparated from it: For the Body is not the *Element* of *Fire*. *Sulphur*, rendred thus Subtile and Volatile, is the Conſumer of what is to be conſumed, that is, what is not fixed in Nature, ſo Diſeaſes are not fixed, but the Body is fixed againſt the Element. And the Element of Fire is only adverſe to that, which is not fixed againſt it, that is, adverſe to *Diſeaſes*. Now would *Pſeudophyſicians* ſo order the matter, as our Philoſophy might find place, and receive Encreaſe in the *Schools* of *Phyſicians*, the Trifles and Impertinencies of Humoriſts (who grope in Medicine as a Blind Man, that knows not which way he goes) being totally rejected, many Homicides, daily perpetrated by their Raſhneſs, would be prevented. In the mean while, ſince they are Men of no Conſcience, what can you do, but leave them to their own perverſeneſs? He that is deſirous to act as a true Phyſician, let him ſeek the Virtues of Elements in Natural things; there he will both find the Truth, and a Remedy againſt the Diſeaſes of the Sick.

There is a twofold kind of Embryonate ♃; one fixed, but notwithſtanding made Volatile; the other, pure Fire; that is, one is Living Fire, the other Inſenſible Fire; yet both the Senſible and Inſenſible are exerciſed in like Conſummation; *viz.* one in Wood, the other in Diſeaſes. Every Man, affecting the Health of others, might by theſe few words be ſufficiently inſtructed, if GOD withſtand not his Endeavours; but I judge every Man ſhall not be made Wealthy, becauſe GOD well knows, why he hath given the Goat ſo ſhort a Tayl. For ſince Riches do very often ſeduce Poor Men, cauſe them to put off the Habit of Humility and Modeſty, and transform them into proud and inſolent Animals, therefore it is more ſafe to keep ſilence, and leave every one to his own poor eſtate.

Now know ye, touching *Sulphur* and its Species; what the Nature, Property and Eſſence, of the ſame is. Whoſoever ſhall attempt to deſcribe *Sulphur* in a moſt accurate manner, (as is fit, though not expedient) will have need of abundance of Paper. But for handling ♃, a judicious Chymical Operator and Experienced Artiſt is required; ſuch a one ſhould be very expert and ſolidly grounded in his Art, no Airy Talkative Perſon, whoſe Art conſiſts in Lip-labour only; but one, that proves himſelf an Artiſt by the Labour of his hands: For ſuch a Man will be able to extract from ♃ more wonderful *Arcanums*, than any Man can deſcribe with his Pen. But, he that knows nothing of *Sulphur*, knows nothing at all, nor is it convenient, he ſhould ſay any thing, either in Medi-

cine,

cine, or in Philoſophy, touching any of the Secrets of Nature.

Of the Uſe of this Element *of* Fire, *which* Paracelſus *hath ſo earneſtly commended to all Phyſicians.*

FIrſt, this Tincture of ♃ may be exhibited in all Diſeaſes, for comforting the Brain, Heart, and all the Internal Members of the Body, becauſe it is famouſly ſubtil, ſavoury, and ſweet; and is a Medicine moſt excellent, eſpecially in Affects of the Lungs. Alſo, it is the moſt penetrating of ſalutiferous Balſoms, for curing every Body internally hurt, and for reſtoring all vitiated Members to their priſtine Sanity; in ſo much, as, in this reſpect, you can ſcarcely find any other *Remedy*, ſecond to this in Virtue. Therefore it may very well ſerve inſtead of *Aurum potabile*; but in firey Diſeaſes, it muſt be warily adminiſtred. This Eſſence of ♃ ſtrengthens weak Stomachs, and gets a good Digeſtion. In a word, in all Diſtempers whatſoever, except Burning Feavers, it may be ſafely uſed.

Note: If any one ſhall extract a red Tincture from fixed ♃ rubifyed, he will enjoy a moſt preſent Remedy, not only for Men, but alſo for ſome Metals; namely, for tinging ☽ and ☿ into ☉. This is that, which *Paracelſus* commended to all the Rivals or Sons of Art ſo highly, that I thought I ſhould do very well here to ſubjoyn his own Words, as they are written.

Mortification of *Sulphur* is made, when its combuſtible and fetid Humidity is taken away from it, and the ♃ reduced to a fixed Subſtance, which is done thus.

℞. Common yellow ♃, which reduce to a fine Powder, and from it three times abſtract a moſt ſtrong *Aqua Fortis*; then the ♃ remaining in the bottom, will be of a black Colour. This edulcorate with ſweet Water, and ſo oft diſtil the Water thence, as until the Water come off wholly ſweet, and ſmells not at all of Sulphur. Then take that Sulphur, and reverberate it in a cloſe Reverberatory, like *Antimony*. In Reverberating, it will ſhew it ſelf, Firſt, White; Secondly, Yellow; and Thirdly, Red; as *Cinnabar*. Having brought it to this paſs, thou mayſt rejoyce; for that is the beginning of thy Riches. For this Reverberated Sulphur in Tinging, renders every Silver into the beſt Gold; and the Humane Body into perfect Health, more excellently than can be deſcribed. Of ſo great Virtue is this reverberated and fixed Sulphur, *&c.*

Elſewhere, *Paracelſus* writes of the Tranſmutation of Metals and Gems, thus: As you now have ſeen a very brief way of ſome peculiar Tranſmutations of Metals; ſo here further know ye, touching the Tranſmutations of Gems, that is, of ſmall Stones, that of ſuch Tranſmutations alſo there are various ways, ſome of which notwithſtanding ſeem in no wiſe adverſe to others. For you ſee how potent a Tranſmutation of Gems lyes in the Oyl of Sulphur. Every Cryſtal, that is left in that Oyl for ſome time, is tinged and tranſmuted, and may by graduation with diſtinct Colours be ſo exalted, as to exceed a Natural *Jacynth*, *Granate*, or *Ruby*, *&c.*

Paracelſus here teacheth the fixation of ♃, if a moſt ſharp *Aqua Fortis* be ſeveral times abſtracted from the ſame, reduced to a fine Powder. But that way of proceeding will profit nothing, becauſe the *Aqua Fortis* is not capable of any Ingreſs into the ♃, becauſe that is firſt to be procured by Salts, as we above taught. For then the Artiſt's Endeavour will ſucceed well, and the ♃ in Abſtraction of the *Aqua Fortis* be fixed, and alſo wax white: But Redneſs is afterward given to it in an open Fire, or Fire of Reverberation. And it will never wax red in a cloſe Veſſel, how long ſoever it ſtands in the Fire. And when it is thus Red, every common Spirit of Wine extracts not its Tincture, becauſe it hath not ingreſs into it. But the fixed red ♃ muſt firſt be melted with fixed Salt of *Tartar* in a very ſtrong Fire. That way is given to it ſuch an Ingreſs, as any Spirit of Wine can extract from it its Tincture. For otherwiſe you ſhall labour in vain. *Paracelſus* intended rather to keep this Experiment to himſelf only, than to expoſe it to the uſe of the ungrateful Vulgar Sort. But no Man hath cauſe to wonder, why I now am deſirous to diſcover the ſame openly, ſince I have peculiar Reaſons of this Publication, an account of which I am not bound to render to any Man. It is ſufficient to any grateful-minded Man, that I am willing publickly to diſcover that Secret.

This fixed Tincture of ♃ is in Medicine much more efficacious, than the Element of Fire, deſcribed by *Paracelſus*. For That is only extracted from a Volatile Sulphur; but This is fixed; and is alſo of power ſufficient to cure the fixed Diſeaſes of Men, as well as Metals. The Volatile Tincture, or Element of Fire, as it is called by *Paracelſus*, is otherwiſe alſo famouſly conducent for External Uſes. All affects of the Skin, as Scabs, and the like, are cured by the help of that. Alſo to every Wine it is a preſent Medicine. For if any one put a little of it into a Cask of Wine, the Wine acquires a grateful Taſt and Odour, and will be ſo comforted, as not eaſily to admit of changing or periſhing, as otherwiſe is wont to happen to common Rheniſh Wine. I did indeed, for tryal-ſake, pour ſome of this into divers Wines, and found it ſo in very deed. For I put one or two drops of our Element of Fire into ſeveral open Cups filled with Wine; and I daily obſerved them, until I found, that that Wine, in which none of the Element of Fire was put, did in two or three days contract a ſlimyneſs; but thoſe, in which a little of the Element of Fire had been mixed, ſtood almoſt three Weeks, before they began to contract the like. Which buſineſs of Wine, if any Man well conſider, he may find out the way, how, by the benefit of this Art only, far more eaſily to acquire ſufficient Gain for daily Suſtenance, than otherwiſe by the perillous ways of Merchandiſe. Wherefore, whoſoever is deſirous of enjoying Profit in Wines, let him always take care continually to have ready prepared by him a good *Sal mirabile*, and reduce Sulphur into a red firey Stone; otherwiſe he will loſe his Labour and Coſt, which, by way of Admonition, I was not willing to paſs over in ſilence. Therefore I muſt ſay, with *Paracelſus*, that all thoſe Phyſicians and Chymiſts are not of the beſt Fame, who have the Gift of Glorious Eloquence; but thoſe only, who have learned their Underſtanding by long uſe of Fire; and whilſt elaborating Subjects, to be prepared, do well know, what ſhould be added and ſubſtracted, according as the Operation of every thing requires.

Since we now know, what *Paracelſus* taught touching the fixation of ♃, and alſo the profitable uſe thereof in Medicine and Alchymy; it will in no wiſe be impertinent in this place to inſert, what *Baſilius* hath written touching the ſame; that by his Words every Man may the better diſcern, that my fixation of ♃, which I have deſcribed to be made by the help of *Sal Nitre*,

Nitre, differs not from the Writings of other Philosophers, speaking of *Salt Nitre*. The aforesaid *Basilius*, (who, in many places of his Writings, mentioned the fixation of ♄ by help of *Salt Nitre*, but obscurely enough) among other things, thus writes.

[*Here* Salt Nitre *is introduced, speaking of himself and to himself only.*]

Sulphur indeed is my most mortal Enemy, and he is also my best Friend: For when we both are joyned together in Wedlock, and our Marriage celebrated in Hell, so, as we both sweat well together; then we shall so put off all Impurities from us, as in our dead Bodies may be found the greatest Treasures, and of us be progenited wealthy Children, *&c.* By which words, *Basilius* intimates, that *Salt Nitre*, by the Contact of ♄, is inflamed, and, as by an Enemy, wholly burnt up and reduced to nothing; and therefore is accounted its greatest Enemy. But if *Salt Nitre*, in form of an *Aqua Fortis*, be associated to ♄, and render it fixed and constant in Fire; they then become the greatest Friends, and from them both are procreated Rich Children. Therefore whosoever is desirous to obtain such Children, let him bend all his thoughts to the matter it self, and diligently search; for he may find, if GOD be pleased to indulge him and permit the same.

Whatsoever *Paracelsus* hath here writ of ♄, he hath undoubtedly writ plain enough, so as Credit may safely be given to his Writings. For that what he saith is not from the purpose, *Every Man may be informed by these few words, &c.* Certainly he, had he not dreaded the impiety of the World, would much more evidently have explained this, and by that means he would have helped the Necessity of many; but the notorious Ingratitude of the World deterred the Man.

Also *Paracelsus* admirably discourseth of the *Element* of *Fire*, how excellent a Medicine it is, as I my self have experienced, and shall further in time to come (if GOD permit). In like manner, the same Man makes mention of the noble *Hyssopaick Art*, by the help of which, ancient Philosophers did, with their own hands, make black ♄ white as Snow, fix it, and by the benefit thereof, do great Miracles in Medicine and Alchymy. This Art, (with Grief be it spoken) by the negligence and injury of former times, was gradually lost; which notwithstanding, from the Caves of Silence, and, as it were, lying in Darkness, this my small Treatise will again bring to Light.

The Prophet *David* seems to have some knowledge of this Royal Art; for when he saw his Sins before GOD, had (as it were) contracted the blackness of a Coal, he thus implores the Divine Mercy: *Sprinkle me, O LORD, with Hyssop, that I may be white: for, by thy well-washing of me, I shall become whiter than Snow.* Whence it is sufficiently manifest, that *David* craved not the well known Kitchin-Herb, *Hyssop*, to be washed with, because that could not help him; but he spake Metaphorically, and requested that his Sins (by the great blackness of which, he believed his Soul to be infected before GOD) might be pardoned, and he received into Divine Favour, and never be driven from the face of GOD to Eternity.

Likewise, there is no Community between the black, gross, and combustible ♄ of Wood, and the pure, fixed and incombustible ♄ of Gold: For as long as black ♄ keeps its combustible disposition, it is refused by the other, as abhorring the familiar Society of so stinking and sordid a Guest. But as soon as that *Ethiopian*, by assistance of the most noble *Hyssopaick Art*, shall be washed white as Snow, and rendred constant in Fire, then it is readily received into Communion by the ☉, and of both is made one Tincture, by help of which, other Metals are reduced to the Perfection of Gold; as a little after shall be shewed more at large. Yet I will first briefly note the difference of ♄, according to my Experience; which is indeed not very necessary, because *Paracelsus* hath done it. Nevertheless, I am very willing to subjoyn these few things.

Ancient Philosophers, as often as they in their Writings treated of the Original and Beginning of Metals, placed the Foundation of their Assertion in *Demogorgon*; *viz.* That he was the Grand-father of all Metals and Minerals, who, dwelling in the Center of the Earth, was cloathed with a bright-red Cloak. But properly, *Demogorgon* is the Central Fire continually burning, and a Subtile Spirit of ♄, distilling it self through the passages of the Earth. If this firey Spirit in its ascent finds a Commodious Cavern, or Humid Place, in which it may abide; it is immediately there coagulated into a Mercurial Water, and by the Central Fire's continual Coction, in length of time, ripened into Metals and Minerals. But the ascending Spirit of ♄, which finds no Seat for its Abode, ascends higher and higher, until it comes to the Superficies of the Earth; into which, when moystened with Rain, it thrusts it self; and from the Ground grows upward into the Air, in the form of vast Bushes and Trees; in which Plants and green Trees, is found such a ♄ as is in Minerals; (yet this is not found so fixed, as that in Metals,) because all things in the Bowels of the Earth are generated according to the Influence of the Stars, and there coagulated according to the nature of the place into these or those Metals. Let him, who is desirous to be taught more at large touching these, consult those Philosophers, by whom the same are plainly enough described. If the pleasure of Operating induce any one to set about this Work, he may make choice of the ♄ he judgeth most sutable to his Intention.

Now behold the Method, in which, by the benefit of the most ancient *Hyssopaick Art*, black ♄ is by a dexterous washing turned into white, rendred fixed and constant in Fire, and by Reverberation transmuted into Redness, and thenceforth used as a Medicine of Humane and Metallick Bodies wanting melioration, and that with notable profit.

Here is presented, first, the Method of Washing Black Sulphur *so, as it becomes very White.*

THe worthy *Paracelsus* doth briefly indeed describe the method of whitening and rubifying ♄, but what was most conducent thereunto, he concealed; *viz.* that way of Preparation, without which no *Aqua Fortis* can have ingress for Washing and Fixing. My purpose is in this place, for the sake of the Searchers of Art, to publish this Secret in plain Words. This may be done many ways, as will appear by the following,

℞. One part of the Terrestrial Sulphur of Pit-coals, or of the Vegetable Sulphur of Wood-coals; with which, reduced to Powder, mix two or three parts of our *Sal Mirabile*, prepared of Oyl of Vitriol and Common Salt. Which mixture put into a Crucible, and

and ſet the Crucible covered in a Wind-Furnace for melting. There the *Sal Mirabile*, by its Acrimony, preys upon the ♀, and diſſolves it; and thence makes a *Red Stone*, which, by pouring Water on, you may diſſolve, Filtre, and again Coagulate, into a Red Salt or Stone. And thus the ♀, by help of the *Sal Mirabile*, through one only abſtraction of a ſharp *Aqua Fortis*, will be ſo habile, as it may eaſily be made white with waſhing, and alſo be fixed ſo, as to ſuſtain the force of Fire, according to this following

Proceſs.

℞. Of this Red Sulphureous Salt, ℔ j. and upon it, in a ſtrong Body of Glaſs, pour ℔ iij. of moſt ſharp *Aqua Fortis:* Yet not all at once, but leiſurely, and at times; becauſe the *Sal Mirabile* with the ♀ loſeth its Acidity, and becomes Alcaliſate, and therefore ſo inimical to the *Aqua Fortis*, as it impetuouſly reſiſts the ſame. Therefore let him, that is ignorant of this, be very wary, leſt all that is contained in the Veſſel fly away, or the Glaſs, through too much heat, burſt in ſunder. For this cauſe, proceed leiſurely, and operate according to the Rules of Art, that your Endeavour may be fortunate. For, in a way contrary to this, you can find nothing, but Damage and Trouble. As often as you put in any *Aqua Fortis*, preſently put on the Head, becauſe it will ſuddenly and haſtily fume, and ſo cauſe damage; to prevent which, after I had ſuſtained ſeveral Loſſes, I at length, againſt ſuch Exhalations, found this Remedy.

In the Top of the Alembick I cauſed a ſmall hole to be made, through which I put a little Tunnel of Glaſs, and luted it on. So ſoon as I had put the prepared ♀ into the Body, and luted the Head and Receiver to it aptly, I through that little Tunnel poured at one time two or three * Lotones of *Aqua Fortis*, and preſently ſtopped the Pipe with Paper; then immediately after great Ebullition, (by its own Virtue, without any external Fire) the ſubtil Soul of ♀ aſcended in a red form. Soon after, I poured on more *Aqua Fortis*, and left it to its own operation. This I did ſo long, and ſo often, as until I had put in ℔ iij. of *Aqua Fortis*, upon ℔ j. of the prepared ♀. When you have thus done, you may adminiſter Fire externally to your Matter in the Glaſs Body placed in Sand, for ſo the *Aqua Fortis* will the more virtually act upon the ♀, and will all aſcend red in Colour; but the ♀ will remain with the *Sal Mirabile* in the bottom of the Veſſel fixed, white, and able to ſuſtain the force of Fire ſo, as it ſeems almoſt incredible, that ſuch a Subſtance, eaſie to be enflamed and burnt, ſhould in a few hours ſpace be exalted to ſo great Fixation and Conſtancy. The Diſtillation ended, and Glaſſes cooled, take up the Body out of the Sand, and thence take out the Salt with the fixed ♀; and to diſſolve the *Sal Mirabile* from it, pour on as much Common Water as ſhall be ſufficient. After extraction of the Salt, the fixed white ♀ muſt be dryed, and kept ſufficiently hot in a Crucible in an open Fire, until the ♀ remains fixed, totally white, and able to abide the Examen of Fire. Then is it fit to be reſerved for ſuch Uſes, as you ſhall learn by the following

Note: If the *Sal Mirabile*, together with the *Aqua Fortis*, ſhall be purified, then the fixed ♀, after Edulcoration, will be white as Snow. But on the contrary, if you do not well filtre the ♀ with the *Sal Mirabile*, and alſo cleanſe not the *Aqua Fortis*, the ♀ will not come forth of a Snow-like Colour, as you may eaſily

* *Half Ounces.*

conjecture. Wherefore, whoſoever would have a Snow-white ♀, he muſt warily proceed, and purely operate, in all parts of his Work. In Medicine, and the Tranſmutation of Metals, ♀ deſtitute of whiteneſs, will ſerve well enough; but if you would apply it to ſuch Uſes, as neceſſarily require a Snow-white Colour, you had need to proceed warily, according to the Preſcripts of Art. For it is of great Concern in every Work, to know, whether the fixed ♀ ſhould have a White or an Aſh-Colour; as in the following ſhall be ſhewed more at large.

Moreover, it is highly neceſſary to be known, that that *Aqua Fortis*, which was poured upon the prepared ♀, and ſeparated from it by Diſtillation, is no more to be reputed Common *Aqua Fortis*. For although it aſcends Red, yet that Redneſs diſappears in a day or two, and the *Aqua Fortis* ſhews it ſelf limpid and clear again; in ſo much, as it can ſcarcely be thought by any Man, that any eminent Virtue is latent in that red *Aqua Fortis* changing again into whiteneſs. Which kind of Ignorance did notably hurt me, whilſt I perſuaded my ſelf, that ſuch an *Aqua Fortis* could not be effectual for any other uſe, or for the ſame, again. But afterward, when I was ſeized with a deſire of ſearching, whence that Redneſs ſhould proceed, and why it again diſappeared; I rectified a pound of ſuch *Aqua Fortis*, in a clean Glaſs Body, to know, whether that Redneſs would remain behind, and no other than the *Aqua Fortis* ſimple aſcend; and, by tryal, I found, that no Redneſs would aſcend, but in that Rectification it ſeparated it ſelf from the *Aqua Fortis*, and reſided in the bottom in the form of Powder, white as Snow. Having done this, I tryed, whether the ſame White Powder were fixed, and I found it to be as fixed, as Gold it ſelf; yet had no ingreſs into Metals, but remained like a white Earth conſtant in Fire. Hence I was ſeized with the delight of thinking, what eminent Virtue might be latent in this Snow-like Powder. Wherefore I again and again made like Tryals, and ſtill found the ſame. Whence a great Light diſcovered it ſelf to me, by which I perceived, that in the vehement Action of the *Aqua Fortis*, in diſſolving the prepared ♀, the moſt clean Soul of the ♀ aſcended with the *Aqua Fortis*, yet in a very ſmall quantity: For out of ℔ j. of ſuch ♀, I had not above eight or ten Grains of this Soul of ♀ left behind. Which thing, at firſt, did not pleaſe me very well, becauſe the ſmalneſs of its weight ſeemed of no value with me. But having made a more exact Tryal, I found this Snow-like Powder to be a moſt excellent Medicine in ſeveral Curable Diſeaſes of the Humane Body, and a true Tincture for Correcting Metals; and therefore afterward I eſteemed it far more than before; and this ſo noble white Tincture, I, by the help of Art, united with Gold, (which is a thing not difficult to be done by a skilful man) and ſo found, that this laudable Tincture, although ſo very white, might, with ☉, in a ſmall Fire, be exalted unto Redneſs, and be of more value than all the ♀ remaining; although that is an hundred-fold more ponderous, than this that aſcended. Yet the Uſe and Fruit of Both, we will a little after ſhew more at large.

Theſe may ſuffice to be offered here, touching the way of Whitening, Exalting and Fixing, common, black, filthy, fugitive, and combuſtible Sulphur, till it is able to ſuſtain the torture of Fire. But before we proceed to the Uſe of this whitened and fixed ♀, we will here ſhew certain other ways of whitening and fixing every combuſtible Sulphur.

Another way of Fixing Sulphur.

℞. One, two, or three ℔. of common yellow ♃ reduced to Powder; upon this, in a glazed Earthen Pot, pour four, six, or nine ℔. of a ſtrong *Lixivium*, made of Lime or Wood-Aſhes, in which, you muſt ſo long boyl the ♃ with continual ſtirring of it, as until the *Lixivium* hath diſſolved as much of the ♃, as is poſſible. Then decant it off, and pour on freſh *Lixivium*, that the ſame may alſo diſſolve as much as it can; repeating the ſame Labour till all the ♃ ſhall be diſſolved. Which Solutions, if you filtre and coagulate into a Red Stone or Salt, the Sulphur will be ſo habile, as it may, by the help of *Aqua Fortis*, be waſhed and fixed.

Another way of Fixing Sulphur.

Diſſolve ♃ in a *Lixivium*, and put that Solution in a Glaſs Body, upon which ſet an Alembick, with an hole on the Top to put a Tunnel through, as before ſaid, and adjoyn and lute a Receiver thereto. Then through the Funnel pour in leiſurely and by degrees ſo much Oyl of Vitriol, as until the mortification of both is perceived, no more ebullition is cauſed, but all action each upon other ceaſeth. This being done, adminiſter Fire by degrees, and a ſubtile Spirit of Vitriol will aſcend, which performs wonders in *Medicine* and *Alchymy*; becauſe it contains Spiritual ☉ in it ſelf, and may be very much ſubtilized by Rectification. In Taſte, it differs little from the Taſte of Spirit of Urine; only that it is more grateful to the Palate, and for every Uſe more efficacious than Spirit of *Sal Armoniack* or *Urine*: Alſo from it the Tincture may be ſeparated, as we will ſhew here following.

The Salt, remaining in the bottom of the Glaſs, muſt be taken out, and by fuſion in a Crucible turned into a Red Stone, which ſuffers it ſelf, *per ſe*, to be fixed in the Crucible in a ſhort time. By the benefit of this Sulphur, all Metals may particularly be amended with great profit. If any one purpoſeth to uſe the ſame Univerſally, let him pulverize this fixed Red ♃, and from it extract a blood-red Tincture with Spirit of Wine: For this Tincture is eaſily extracted, and by *Paracelſus* is called, *The Element of Fire*, and was by him highly eſteemed. Undoubtedly the chief Reaſon why this Philoſopher called it *The Element of Fire*, was, becauſe in the Operation he viſibly diſcerned four Elements. For, the Extraction ended, (which may be abſolved in 24 Hours) on the top is a beautiful Red Ruby-like Tincture, under which is a white Liquor, and in the bottom an Aſh-like Earth. The little Skin ſeparating the Tincture from the white Water, is taken for the Air. Therefore this way alternately, the four Elements preſent themſelves to ſight in the Glaſs without confuſion; ſo as although you ſhake them together an hundred times in an hour, yet they will never be mixed, but after that agitation, every of them recovers its priſtine Station. The fruitful Uſe of this *Element of Fire*, ſhall be further ſpoken of afterward.

Note; As we have here now taught the way of waſhing and fixing common Yellow ♃, and the black ♃ of Pit-coals and Wood; even ſo may the ♃ of *Antimony*, *Vitriol*, *Auripigment*, and other Minerals, be whitened and fixed.

But the method, by which ♃ is extracted from Metals and Stones, ſhall (GOD willing) be ſhewed in a peculiar Chapter. In the mean while, here is declared,

The Uſe of our Fixed Sulphur, *and, firſt, in Medicine.*

Firſt, this ♃ whitened by Lotions and fixed, is a moſt excellent *Bezoardick*, and much more ſafe in its Uſe, than the Oriental *Bezoar*, which is ſold indeed for a greater price, yet never diſcovers any viſible and ſenſible Effect. On the contrary, our *Bezoar* deſervedly is preferred before it, eſpecially in the Peſtilence, and all other Diſeaſes, where Sweating is needful.

Alſo, in all Affects of the Lungs, it yields more Comfort and Relief, than all other Medicaments, which are prepared of ♃ not cocted nor fixed, but only crude. Likewiſe, to Men of every Age, whoſe weak Stomachs are proſtrated by an heap of aqueous and viſcous Humors, it is a preſent Remedy; becauſe by its dryneſs it totally abſumes all Phlegmatick ſuperfluous Humidities, and perfectly reſtores the Stomach. What ſhall I ſay? It may in a ſpecial manner be commended, as a Cordial and excellent Confortative againſt the imbecillity of Age. And outwardly, it may ſerve for a moſt excellent Coſmetick; and, in like manner, by the Spagyrick Art, be reduced into an admirable ſweet Oyl, by the benefit of which, the yellow and blackiſh Skin of Women may be tinged with a beautiful white Colour: Not like any other vulgar Coſmetick, which doth indeed whiten the Skin, but that may again be waſhed off with Water; not ſo, I ſay, but in ſuch a manner, as the Skin, thus elegantly tinged, can in no wiſe be waſhed off again. Yet in length of time, that whiteneſs of the Tincture will wear away, and the Skin recover its native blackiſh Yellowneſs: Wherefore it muſt be tinged again, as often as ſhall be needful. Whence it is manifeſt, that ſuch a Tincture is admirably uſeful in beautifying rich Virgins, and curious Matrons.

Moreover, this Oyl of Talk is efficaciouſly prevalent in curing ſuch Affects of the Skin, as are called, *Impetigo's*, *Serpigo's*, and *Lichene's*; alſo Scrophulous Tumors riſing about the Noſe, or in any part of the Face, and proceeding from an Inflammation of the Liver. This Oyl takes away all ſuch cutaneous Vices, and beautifies and heals the deformed Skin, reſtoring it to its native Colour.

The Uſe of the ſame in Chymiſtry.

Fixed ♃, as well in the humid, as in the dry way, tranſmutes imperfect Metals into ☉ and ☽. Moſt readily ♄ and ♀, in the humid way; and moſt eaſily ♂ and ♃, in the dry way. From every ☽ it ſeparates ☉ by fermentation. If it be added to prepared Metals, the ſame Metals diſtilled by Retort give forth from themſelves living Mercury, which permits it ſelf to be fixed with ☉ into a tinging Stone. Whenſoever old *Demogorgon*, or the Grandfather of Metals, through his extream Age, decays in ſtrength, and waxeth bald, he devours his youngeſt Son, whereby he is ſo greatly comforted, as he is able to give to all his Sons and Servants golden Crowns.

Note: You are to underſtand the devouring of the Son to be, when old fixed ♃ ſwallows and devours crude and not fixed ♃, and thereby acquires to it ſelf Flux and Ingreſs, by the help of a certain Miniſter, who moſt diligently watcheth his Sepulchre ſo long, as until Father and Son (or the fixed and fuſible) be mortified, and riſe together renovated.

Alſo

Alſo from our Hoary headed *Demogorgon*, of exact Age, by the addition of other Matters, is made a moſt white * *Amauſum*, in the acquiſition of which, *Goldſmiths* do greatly delight; becauſe they can adorn their Artifices therewith.

**Amill.*

Behold I preſent you the way of Opening and Conſtituting a perpetual Metallurgy of ☉ and ☽.

We above taught, that ♄ (after it is waſhed into a Snowy whiteneſs, and alſo ſo fixed, as it is able to ſuſtain the Examen of Fire) was endued with power of amending all Metals. For the whitened ♄, by Gradation, turns them into ☽, and the Rubifyed into ☉. But here a great Obſtacle is wont to intervene, ſo as this Work of ſo great profit, cannot eaſily obtain its Effect, anſwerable to the Wiſh of every operating Chymiſt; *viz.* becauſe by Fixation the ♄ is ſo totally deprived of its Fatneſs, penetrating Power, and eaſy Flux, as it degenerates (as it were) into a dead Earth, which, *per ſe*, alone loves not to enter into any Metal, but chooſeth firſt to have Ingreſs duly prepared for it by the help of other Fuſibles, ſuch are vulgar, immature, and combuſtible Sulphur, or Antimony; which do indeed penetrate the dead ♄, and render it ſo fuſible, as it is capable of Ingreſs into Metals.

But ſince ſuch combuſtible ♄ or ♂, is ſo very noxious to Metals, as it makes them black, volatile, and brittle, and ſo commonly doth as much hurt as good; therefore we, not approving of ſuch an Ingreſs, endeavoured to find out a better. Indeed, although every ♄ may another way be ſo fixed, and rubifyed, without the help of *Aqua Fortis*, as to retain its own Ingreſs; yet ſuch a fixation (though eaſily done, and requires little Charge) cannot be compleated without a very long time. I intend to deſcribe this way of Fixing; but firſt ſhall be ſhewed the method of procuring a ſafe Ingreſs to this fixed ♄ by a whitening *Aqua Fortis*.

Firſt, we taught, the ♄ was to be reduced by our *Sal Mirabile*, then that a moſt ſharp *Aqua Fortis* was to be abſtracted from it, and after Abſtraction the *Sal Mirabile* to be ſeparated from the white fixed ♄ by common Water, that the ♄ might be dulcifyed and rendred fit for Medicinal Uſes. Now I teach, that the ♄ fixed by *Aqua Fortis* is not to be edulcorated, but the *Sal Mirabile* to be left with it; being that, which prepares Flux and Ingreſs for its penetration into Metals, inſomuch as Neceſſity now urgeth us to ſeek a better Ingreſs, *viz.* this way;

The way of adding to Fixed ♄ a Ferment, by the benefit of which, is acquired Ingreſs into Metals, penetrative, and amending the ſame.

Above, where we treated of the way of fixing Sulphur, we taught, that after it was reduced by *Sal Mirabile*, a moſt ſharp *Aqua Fortis* was to be poured upon it, and thence to be abſtracted, and that in the time of Abſtraction, a little Volatile ♄ would alſo aſcend with the *Aqua Fortis*, whence the *Aqua Fortis* waxed Red, and that ſuch a Redneſs might be ſeparated from the *Aqua Fortis*, in form of a fixed Powder white as Snow, which might be uſed in *Medicine* and *Alchymy* with great profit. Yea, ſuch a fixed ♄ white as Snow, doth not only ſerve for an admirable Coſmetick; but alſo this ſmall Quantity of ♄ deſerves to be highly commended by Phyſicians, as a moſt excellent *Diaphoretick*, the like of which you can no where find. For indeed, Oriental *Bezoar* is not comparable to this of ours. Our *Bezoar* is the true Unicorn's Horn of the ancient Philoſophers. This our Philoſophick Unicorn, is that moſt potent, hoary, and aged, King of the World, who, as ſoon as he hath devoured his young Son, encreaſeth in ſtrength ſo admirably, as he tranſforms his Gray Hairs into Red, and triumphs in his being able to give to all his Servants golden Crowns, and alſo to make them Kings. For he is no more ſuch as he was, *viz. Venom*, or *Black* blacker than *Black*, or a wild and horrible *Beaſt* in the *Wood*, but is changed into our Oriental *Bezoar*, *White* whiter than *White*, Univerſal *Treacle*, *&c.* So great a power doth he poſſeſs, after he hath been prepared according to the Method above preſcribed.

If any one be deſirous to exalt the Faculties of this ♄, he will not loſe his Labour, if before fixation he diſſolve ☉ in *Aqua Regis*, and pour this Solution of ☉ upon the ♄, inſtead of another *Aqua Fortis*; and abſtract it from thence again. For ſo doing, not only the ☉ remains fixed with the ♄, and gives Ingreſs unto it; but alſo the *Aqua Regis*, or Spirit and Salt of the World, with the Snow-like Soul of ♄, will carry with themſelves over the Helm the clean Soul of ☉, and ſo produce a far more excellent Medicine, than if only the Soul of ♄ did aſcend alone; as every Man may eaſily conjecture. But if any one is deſirous to operate better, he may, if he will, diſſolve the Gold alſo in a Crucible, together with the Sulphureous *Sal Mirabile*; and preſently after abſtract from it a moſt ſharp *Aqua Fortis*; which way the ☉ is ſo much the better united with the ♄. Although I could diſcover much more touching this way of Operating, yet ſince (becauſe I have publiſhed already as much as is fit) no Neceſſity obligeth me to ſuch a publication, I will forbear to ſpeak further hereabout.

The way of bringing this fixed Snow-like ♄ to Redneſs, the Laudable *Paracelſus* here teacheth; *viz.* that it muſt be made Red by a flaming Fire. Yet it muſt not be covered (as he mentions) but open: For this way it will wax Red, otherwiſe it would remain White. Now, that ♄, to which you add ☉, needs no Reverberation; becauſe by the ☉ it is turned into a purple Colour, and the ☉ it ſelf, by help of the fixed ♄, becomes irreducible, and paſſeth into Tincture, and ſo needs no further Exaltation. Therefore to whomſoever GOD ſhall be ſo propitious, as to give him this Salt of Metals, together with the knowledge of conjoyning it with the Red Soul of ♄ and ☉ which aſcends, he will ſhew himſelf both in *Medicine* and *Chymiſtry* a principal Maſter: But whoſoever is ſo blind, ignorant, and witleſs, as he cannot diſcern what I have here ſo largely treated of, ſuch a Man aſſuredly labours with an uncurable Blindneſs, ſo as you cannot recover his Health, although you ſhould put double Spectacles on his Noſe. Now to deſcribe the method of fixing ♄ ſo, as it may retain its Ingreſs, wherewith to penetrate into Metals, I purpoſe not in this place; but it ſhall (GOD willing) be deſcribed, where we treat of our Secret *Sal Armoniack*. Here follows,

The way of Preparing a perpetual Metallurgy of ☉ and ☽, by the help of Fixed Sulphur.

Let the Benevolent Reader know, I do not affirm, that all whatſoever I ſhall here write touching the perpetual Metallurgy, I my ſelf have tryed, or took care to ſee elaborated. For the fixation of ♄ hath not been known to me above two or three Years, during which time, I have been for the moſt part diſtempered in my Body ſo far, as I had ſcarcely ſtrength enough to pro-

proſecute my more ſecret *Arcanum's*, which are far more dear to me, than any fixed ♄ can be. Yet, in the mean while, I could not chooſe but employ my Thoughts upon ſuch a Method, which being found, any one might, by the help of fixed ♄, reap a gainful Crop of Fruit from the tranſmutation of Metals.

To accompliſh this, I could find no way more eaſy, than for a Man, of Elixiviat Aſhes (not of Bones, but) of Wood, well ſifted, to make large *Cineritiums* or Teſts, in Iron Molds fit for the purpoſe, and with that Wood-Aſh, mix a ſmall part of the fixed ♄; and then take care to cupellate Silver mixt with Copper, (with the due addition of Lead) according to the common method of Art, upon ſuch Teſts. For thus, the ☽ will be purifyed, and the ♀ and ♄ paſs into the Teſt, as is otherwiſe wont to happen in all other purifyings of Silver. Theſe Teſts, (which you may keep by you, until you have a ſufficient Quantity) in the uſual manner put into a melting Fornace, that in a ſtrong Fire the ♀ and ♄, which paſſed into the Teſt, may co-unite with the fixed ♄, and ſo attract it to themſelves, as they may come forth impregnated with ☽ and ☉. Now if this Coppery ♄ be cupellated on ſuch a Teſt prepared with ♄, the ☉ and ☽ will remain upon the Teſt, and the ♄ and ♀, as happened before, will paſs into the Teſt. And if you again proceed with them as before, infallibly (by ſuch a way of Cupellating) you will, with the help of fixed ♄, from ♄ and ♀ acquire gradually a Quantity of ☉ and ☽ not to be contemned. By this way of Operating, in all thoſe Regions, where Coals are cheap, a Man may get a competent Livelyhood. For although in Cupellating there is ſome loſs of the ♄ and ♀, they turning into *Scoria's*; yet this ſmall loſs, in theſe poor Metals, is nothing, in compariſon of the great Gain, which may be expected from the more Rich. I reckon, this Operation of Cupellating coſts no more than the price of the Coals; for the damage made in ♄ and ♀ is richly recompenſed by the ☉ and ☽ acquired. I was willing to communicate this to the *Lovers of Art*. Therefore, if there be any Curious Refiners, to whom this Proceſs is pleaſing, let them put it to the Tryal; if they will not, 'tis all one to me: For I will make no Tryal in ſuch Works, as require a Man ſtrong and patient to labour in the Fire. In the mean while, I doubt not, but there will be ſome, who will amply encreaſe their Fortunes thereby; upon whoſe Endeavours, I pray for the Divine Bleſſing, and offer to their Conſideration this ancient Proverb, *By Saturn and Mars, by Fire and Art, a Treaſure is found.* *Mars* is fixed *Sulphur*: Much might be ſaid for *Saturn* alſo; but that is not ſo conducent as fixed ♄, which is much purer than rude Iron, as Experience teacheth.

Touching the further uſe of fixed ♄ in the Emendation of Metals, and that in an humid way, by fixing and graduating *Aqua Fortis's*, the Acrimony or Corroſive Power of which, is firſt ſo broken by the help of fixed ♄, as they do not diſſolve, but only penetrate them, and deduce them to an higher degree, and, according to the nature of the ♄, tinge the ſame into whiteneſs or redneſs.

It is known to us, that nothing tingeth but ♄ only; and that, according to its Nature, into redneſs or whiteneſs, both in the humid and dry way. In the dry way, the ♄ muſt of neceſſity be ſo fixed and fuſible, as being caſt upon the Metal in flux, it may penetrate into it, as Oyl into a dry Skin. You have already heard, that in fixation by *Aqua Fortis*, from the ♄ is ſo taken away its Ingreſs, eaſy Fuſion and Metallick Fatneſs, as it rather ſeemeth like a dry Earth, than a Metallick Subſtance; in ſo much, as unto it cannot be procured a ready Ingreſs into Metals, unleſs by ſome ſingular Art and Induſtry. Such an Ingreſs cannot be given to fixed ♄ in a better way, than by Mercurial mundifyed Metals, *viz.* by ☉ and ☽, and indeed ☉ unto Redneſs, but ☽ unto Whiteneſs. If you would proceed more dexterouſly, you muſt legitimately unite fixed ♄ with the Salt of Metals; then will be acquired Ingreſs into all Metals, as hereafter in the Deſcription of the *Salt of Philoſophers* ſhall be ſeen. But if Fortune ſhall ſo favour any Man, as he can find out ſuch a Water, as is endued with the power of diſſolving fixed ♄, he will enjoy ſo potent a Gradatory Water, as will convert black Leprous ♄ into moſt white pure ☽: And not only ♄, but alſo ♃, ♀, and ♂; yet ♄ moſt readily. Touching ſuch a Gradatory Water, (as far as I have learned by Experience) thus take it: Every ♄ whitened and fixed by waſhing amends Metals; but how it ſhould have and acquire Ingreſs into them, is not known. Therefore, as it is the part of Art and Induſtry to procure to fixed ♄ a dry Ingreſs; ſo alſo it is no leſs the Work of Art and Induſtry to convert fixed ♄ into a Water, by which, vile Metals may be exalted to a more excellent degree of Gold and Silver. Therefore, let him, who intends to convert fixed ♄ into Water, obſerve, that this Water muſt not be ſo ſtrong as to diſſolve Metals, but ſavour only of ſo much Acrimony as will be ſufficient to penetrate them, and deduce ♄ into an humid form, *viz.* ſuch as it is tinged with, either white or red, according as the Gradatory Water ſhall be made, either of red or white ♄. Whoſoever well underſtands how to change fixed ♄ into Water, unto him will be opened a Compendious way of Graduating vile Metals into ☉ and ☽. Which Operation is, of all, the moſt commodious for ♄, becauſe *Aqua Fortis* more readily preys upon, and diſſolves, other Metals than ♄. For it is prejudicial to diſſolve any, becauſe in Graduation Metals are not to be diſſolved, but only to be penetrated, with conſervation of their forms, as they were when put in, and, without any diminution, to be tranſmuted into better Metals; which in ♄ is moſt eaſy to be done. Yet any *Aqua Fortis*, although you add to it thrice ſo much common Water, will prey upon and diſſolve ♄, ♃, ♀, and ♂, which is a thing to be ſtudiouſly avoided. Into the aforeſaid Gradatory Water, in which the fixed ♄ is, caſt a little common Salt, then the *Aqua Fortis* becomes Enemy to the Lead, and aſſaults it, but indeed only to penetrate, (not to diſſolve the ſame) and to introduce the fixed ♄. After the Lead hath lain in ſuch Water about 14 Days, it will ſwell and wax white, leaving one half of it ſelf upon the Cupel. But the longer it ſhall lye in the Gradatory Water, ſo much the more amended will it be.

If fixed ♄ could as eaſily be turned into Gradatory Waters, the ſame may eaſily be fixed; aſſuredly in the whole World there would be no one particular more deſirable than this, by the help of which, great Riches might be acquired. For this ſame humid Graduation requires almoſt no trouble or labour, more than putting filed or raſped Lead for ſome time into the Gradatory Water, and after Gradation, to take it out and cupellate it; being ſuch a kind of Work, as by Chymiſts is accounted a Childiſh Labour.

But to know and be able to convert fixed ♄ into a Gradatory Water, is the principal Artifice; and to participate of that, all diligence muſt be uſed by him, whoſoever he be, that is deſirous to reap pleaſant and profitable Fruits from Chymiſtry. What do you deſire? All things needful to be ſpoken, cannot clearly

be

be explained with a Pen; yet if any one ſhall acquire the Salt of Metals, he may eaſily ſo far introduce fixed ♄ into Metals by that, as they ſhall be amended thereby. Hitherto I have plainly enough deſcribed the Fixation of ♄, and prolixly demonſtrated, how ingreſs may be procured to it, as well by the Humid, as by the Dry way. Wherefore, whoſoever ſhall think himſelf concerned herein, let him follow theſe Preſcripts, until he find ſo much Good, as the favour of GOD will grant to him. For the All of our hope depends on the bleſſing of GOD.

In the mean while, I am not willing to conceal from the Searcher of Art, this one only Artificial Manual Compendium, of converting ♄ eaſily into a Gradatory Water. We above ſaid, *Aqua Fortis* could find no ingreſs for it ſelf to the fixing of ♄, before it was procured to it by the help of *Sal Mirabile*. Therefore, ſince the way of preparing *Sal Mirabile* is various, and one Salt is always more conſtant than another; great Caution muſt be uſed, that the Sulphur be ſo handled and accommodated, as it may be ſuddenly diſſolved by the ſharp *Aqua Fortis*, and ſo not be precipitated into a white Powder. For if this be not done, it will indeed be fixed by the *Aqua Fortis*, but become very difficult to be diſſolved. If it be well diſſolved the firſt time, after Fixation it will be eaſily diſſolved. Which is a thing worthy and profitable to be obſerved: For the whole hinge of Art conſiſts here. Therefore, if any one be well Skilled in Spagyrick Labours of Fire, he will eaſily bring this Preſcript to a good Effect; but if he be not ſuch, he will Labour in vain, and loſe his Charges; and that not without the good Pleaſure of GOD, who Wills not, that every Man ſhould be made Rich. Nevertheleſs, if any one, with an indefatigable ſtudy and patience of Search, ſhall hit the Mark, he will give thanks to GOD and to me: If not, let him impute the Error to his own unhappineſs, ſince I have writ ſo openly and clearly, as no Man before me ever did. My purpoſe is in this place to diſcover one moſt excellent Secret; by the benefit of which, fixed ♄ may eaſily be changed into a Gradatory Water, and that the following way.

Chooſe ſuch ♄, as unto which Nature hath given greater Efficacy, than to the common ♄; ſuch, I ſay, as is in a ſort Mercurial, and in which ſuch beginnings of the Operation of Nature diſcover themſelves, as thence may be made a Metal of a Golden Diſpoſition. Such a Mercurial ♄ you ſhall ſcarcely find in all the Metallurgy of Gold; and that naturally Red, both internally and externally; and is otherwiſe called by *Paracelſus Embryonate Sulphur*, or *Cinnabarine Sulphur*, or immature mineral *Electrum*; but by Miners vulgarly called the *Flower of Gold*: Alſo you may perceive it to have a great Communion and ſimilitude with *Auripigment* and *Antimony*. This *Sulphur* is Mercurial, and toucheth Metals with a more near Affinity, than vulgar ſimple ♄, becauſe after Fixation it is eaſie to be diſſolved, and before Fixation better to be wrought upon than common ♄, which partakes of no Mercury. And this ♄ in the abſtraction of *Aqua Fortis* gives forth more of a beautiful Tincture, than any other common ♄. Alſo this pure Soul may much better be uſed in *Medicine* and in *Alchymy*, becauſe it is both Mercurial and of greater Efficacy, than the Soul of any common ♄.

Note: Common ♄ is not ſo eaſily prepared for Solution, as this; becauſe it is Mercurial, and therefore, hath more Communion with *Aqua Fortis*, to be diſſolved by help of it. And after it is diſſolved, in the Diſtillation it gives forth more Soul; and the fixed ♄, which remains in the bottom, is of greater Virtue in *Medicine*, than the other of common ♄. For by how much the more pernicious Venome it was before Fixation, ſo much the more Efficacious *Medicine* doth it become, after the Venome is inverted by Fixation, and converted or prepared into an Antidote or Treacle. Such ♄ may alſo another way, more commodious, than by *Sal Mirabile*, be prepared for eaſie Solution: Which indeed is a thing of great moment, and worthy to be obſerved.

This ſhort, but neceſſary, Admonition I thought good to ſubjoyn for the ſake of the Searchers of Art; to the end it might be known, that one ♄ is better than another for preparing the aforeſaid Gradatory Water. Nevertheleſs, the known common *Sulphur*, as well as that of Wood, is ſufficiently conducible to be waſhed and fixed. More at this time I have not to adviſe. In the mean while, if any one be deſirous to Labour, he may ingeniouſly ſearch out all things fit for his Invention, and earneſtly ſtrive for Riches. For I, without Envy, or cloſe Concealment, have ſo openly ſpoke my mind, as the leaſt blame cannot juſtly be imputed to me. But to prevent the Infelicity of thy Error, my Reader, I could not do better, than I have here done by Writing. Let it not be tedious to Thee to tread in our Footſteps, and in the Footſteps of others, ſo long, as until you can attain to a fortunate and deſirable End; which will Crown your Work: Which Work, by Idleneſs and ſloath, together with ſupine Ignorance, can never be accompliſhed.

Having communicated theſe Gratis, every Man may hence ſatisfie his Deſires ſo, as not to trouble me further with his Inquiries.

A COROLLARY.

WE, in this ſmall Treatiſe, have plainly ſhewed the Way or Method, by which, every black Volatile and Combuſtible ♄ may in the ſpace of one day be converted, by waſhing, into a Snow-like Candor, fixed and rendred conſtant in Fire.

Alſo how, in Fixation, the *Aqua Fortis*, being abſtracted from the *Sulphur*, carries with it ſelf the moſt pure Soul of the *Sulphur*, renders it fixed and durably pernament in Fire; and beſides, that it is not only a preſent Remedy for expelling Diſeaſes moſt grievous in the humane Body; but alſo, that it is endued with the Power of tranſmuting imperfect Metals into ☉ and ☽, yet particularly only, being deſtitute of ſuch ☿, as can ſufficiently extend it ſelf in Efficacy.

Likewiſe we have taught, how to the more groſs part of the ♄, which remains in the bottom, ingreſs may be procured for the amending of Metals with Profit, both in the humid and the dry way.

Laſtly, we ſhewed, how much one ♄ excels another, and ſuch ♄ was to be accounted more excellent which contained in it ſelf pure ☿; and that eſpecially to be the moſt excellent, which before Fixation was judged moſt venemous; and that for this Reaſon, *viz.* becauſe every Supream Venome, after Preparation, will become the higheſt Medicament; and that the Melioration of ſuch *Sulphur* is much more Efficacious, than common *Sulphur*. Wherefore in this place, I am willing, again and again, earneſtly to commend to the

Lovers of Art *Antimony*, Red *Arsenick*, Yellow *Auripigment*, Ash-coloured *Cobaltum*, *Cakimia* and *Zinck*, with *Bismuth*; becauſe all theſe are more excellent than common *Sulphur*. But he, that elaborates ſuch Subjects, ſo venemous, muſt ſtudiouſly beware of the evil Fumes ariſing from them. For as ſuch a Subject before Preparation is mere Venome, ſo, in preparing, its venomous Diſpoſition is more and more increaſed; but after Preparation, that which was deadly, now becomes a moſt Salubrious Antidote or Treacle, and preſent Remedy againſt all kinds of Poiſons.

Note: Whoſoever is deſirous to be ſecurely freed from all Peril, him I would adviſe, to learn the way of fixing ſome common ♄, before he raſhly attempts to invade the Fort of ſuch noxious Venoms.

Therefore, whatſoever we have hitherto taught are not vulgar Matters, or Arts well known before, but merely great *Arcanum's*, and thoſe very lately invented. For, who could believe, that common ♄, a Subſtance eaſily inflameable and burnable, ſhould in one day be ſo fixed, as to be able to remain unhurt againſt all the force of *Vulcan?* Who could have perſuaded himſelf, that the moſt venemous Venoms, as *Cobalt*, *Arſenick* and the like, may in one day be Artificially inverted, and their mortal Venoms converted into Salubrious Antidotes? Laſtly, who could ever have thought, that of the moſt Volatile Mineral Subjects, as ♄, *Antimony*, *Arſenick*, *Auripigment* and others of that kind, in the ſpace of one day may be prepared a Tincture (conſtant in Fire) for humane and Metallick Bodies? No Man, if we had not in this ſmall Treatiſe ſo evidently demonſtrated that, as it may be plainly underſtood. Wherefore, as I have formerly ſaid, ſo I am now ready to affirm, that I, in this ſmall Treatiſe, have revealed ſo great and admirable *Arcanum's*, as no Man (as far as the Memory of Man can tell) hath publiſh'd any thing more clearly than I, touching ſuch Secrets.

If any one is deſirous to Learn, whence ſo ſwift a Fixation of combuſtible *Sulphur*, or ſo ſudden *Metamorphoſis* of moſt deadly Venoms, ariſeth; to him, I will now diſcover the Cauſe. It is ſufficiently manifeſt, that Spirit of *Nitre*, as well as *Aqua Fortis* diſtilled from *Vitriol* and Salt *Nitre*, poſſeſs ſuch a fiery Diſpoſition, by which all combuſtible and Volatile Minerals are ripened. And being ripened, they are alſo fixed; as if fixed things muſt of neceſſity be Mature, and conſequently no more noxious or deadly to Mortals. For whatſoever is rough, crude and immature, the Stomach of Man cannot digeſt, but rejects and caſts out that, (by which it may be injured) as Venome: According as is eaſily diſcerned in all *Cathartick's*, either Vegetable, Animal or Mineral, which, by reaſon of their Crudity, are ſo great an offence to the Stomach of Man, as it frees it ſelf from them, either by Vomit or Seidge. And the more crude and immature Purgers be, the more ſtrongly do they Operate. Hence uſually (by the Preſcript of Phyſicians) Purgers that are too violent, before they be taken into the Body, are amended by Fire. As for Example. *Squills* and *Diagridium*, which too vehemently Purge, are covered over with Dough and baked in an Oven, for correcting the exceſſive Purging property in them, that they may cauſe Evacuations more moderate and more ſafe. *Antimony* immoderately Purging, is excocted, or melted in an open Fire with common *Nitre* and *Tartar*, by which it is ſo far corrected, as it Purgeth without vehemency. The ſame alſo is ſo corrected by Spirit of *Nitre*, as it loſeth its purging Property, and inſtead of its Cathartick Virtue, acquires to it ſelf a *Diaphoretick* and *Diuretick* Property.

Common *Tartar*, taken into the Body, performs the Office of a *Cathartick*: But the ſame, when the ripening Heat of the Sun, in the more hot Regions of the World, hath took from it, its Acidity, and it, in the Fermentation of Wine, becomes a fiery Spirit, it no more exerciſeth a purging Property, but rather hinders Purgers, and ſo amends them, as they cannot Purge with ſo great vehemence, as they were wont to manifeſt, before Correction; as is already demonſtrated by Us, where we treat of the Extraction of purging Vegetables. Therefore if the common Fire of Coals, and Spirit of Wine, correct Vegetables and Animals immoderately purging; why ſhould not the moſt ſtrong Fire of Salt, ſuch as *Aqua Fortis* is, correct the moſt venomous Mineral Subjects, and be able to tranſmute the ſame (depoſing their noxious Qualities) into an Antidote or Treacle?

From all which, it is ſufficiently manifeſt, that in correcting even the moſt venomous Subjects, Mineral Spirits of Salt are ſufficient; being ſuch, as can deprive them of all their pernicious Venome, and change them into ſalutary Medicaments. Wherefore, I doubt not, but that the ingenious Reader, by theſe few things demonſtrated, will ſufficiently underſtand the cauſe of this ſudden Correction or Fixation of all Volatile and venomous Mineral Subjects. When Ancient Philoſophers, by Poetical Parables, deſcribed the laborious Navigation of *Jaſon* to the Iſland *Colchos*, where reſided an huge *Dragon* vomiting Fire, which, with Eyes never cloſed, diligently watched the Golden *Fleece*; they added this, *viz:* that *Jaſon* was taught by his Wife *Medea*, to caſt to this waking *Dragon* an edible *Medicine* to be ſwallowed, whereby he ſhould be killed and burſt; and that *Jaſon* ſhould preſently take the *Dragon* (thus ſlain) and totally ſubmerge him in the *Stygian* Lake. *Jaſon*, in this ingenious Fable, Hieroglyphically repreſents the Philoſophers; *Medea*, accurate Meditations; the laborious and perillous Navigation, ſignifies manifold Chymical Labours; the watching *Dragon* vomiting Fire, denotes Salt *Nitre* and *Sulphur*; and the Golden *Fleece* is the Tincture or Soul of *Sulphur*, by the help of which, *Jaſon* reſtored Health to his Aged Father, and acquired to himſelf immenſe Riches. By the Pills of *Medea* is underſtood the Preparation of *Sulphur* and *Sal Mirabile*. By the total ſubmerſion of the *Dragon* in the *Stygian* Lake, is intimated the Fixation of *Sulphur* by *Stygian* Water, that is, *Aqua Fortis*. Whence, it is ſufficiently clear, how obſcurely the Ancient Philoſophers did deſcribe their Fixation of ♄ by *Nitre*, and how ſecretly they hid it from the Eyes of the unworthy. But, ſince I, in this Treatiſe, do as clearly as is poſſible diſcover all things, know, that I do it not without Reaſon. It will be enough for any one, if he rightly underſtand the Method of performing ſuch a Fixation.

After any combuſtible ♄ hath been fixed by *Aqua Fortis*, or *Aqua Regis*, and ☉ and ☽ added to it in Fixation, then will that no more be vulgar ☉ or ☽, being ſuch as cannot again be diſſolved in *Aqua Fortis*, or *Aqua Regis*, nor upon a Cupel have Ingreſs into ♄, but paſſeth as it were into a dry Earth, which can neither be reduced by *Borax*, nor any other common fluxing Powders into a ductile Body. If any one be deſirous to know this by Experience, let him diſſolve ℥ ſß of ☉ in *Aqua Regis*, and pour this Solution upon a Pound of *Aqua Regis*, and alſo put this *Aqua Regis* upon ℥iiij of Butter of *Antimony*, and abſtract the *Aqua Regis* thence, Then he will find, that

Gold,

Gold, which was in the *Aqua Regis*, to have mixed it ſelf Radically with the *Sulphur* and *Mercury* of *Antimony*; ſo as not only the Butter of *Antimony* becomes fixed and irreducible, but it alſo renders the Gold ſo irreducible, as thenceforth it can no more be ſeparated from the *Antimony*, but remains adhering to it in every Examen: And can only be ſubduced by our Secret Salt of Metals, volatilized, or rendred fuſile, and ſo be introduced into other Metals for their Amendment.

Therefore, if ſuch a deſtruction of ☉ can be made by *Antimony*, leſs than the half of which is ♁, but the greateſt part ☿; how ſhould the ſame not be better performed by common ♁, which is void of all *Mercury*? I, in all thoſe places where I have taught the Fixation of *Sulphur*, did always adviſe, that *Aqua Regis* to be carefully kept, which was abſtracted from the *Sulphur*; but eſpecially what contained Gold; becauſe together with the *Aqua Fortis*, the moſt pure Soul of *Gold* and *Sulphur* aſcends, and is as much fixed, (I might ſay, more) as that which remains in the bottom. Wherefore, if what I have here imparted be obſerved by any Reader, or by none, it ſhall not trouble me, but I ſhall remain well contented, that I have done my Part, and performed ſo much, as no Man before me ever did; becauſe I have openly taught the Method of extracting in a few hours (by the help of Diſtillation) from ☉ and ♁, or from ☉ and *Antimony*, a fixed Tincture. And theſe I do willingly communicate to the Searchers of Art.

Some write, that *Miriam* the Propheteſs, and Siſter of *Moſes*, knew the Art of elaborating the Tincture in three days, which ſeems incredible to many Skilful Writers. But what will envious Perſons judge, when they ſhall hear, that *GLAUBER*, by a publick Writing, without any manner of Concealment, hath taught the Method of extracting a fixed Tincture out of ☉ and *Antimony*, fit to expel all deſperate Diſeaſes out of the humane Body; and this work to be compleated in one day? Undoubtedly they will exclaim and ſay: *All are Lyes, and ſuch things are impoſſible to be done.* The ignorance and wickedneſs of theſe Men were much more tolerable, if, to their Calumnies, they ſhould alſo add, *Our ignorant Brains perſuade amiſs.* For did they rightly know themſelves, they never would ſo baſely condemn and reprove the Experience of Others. But what ſhall I write againſt ſuch? Nothing, but the Old Proverb, *Effeminate Men, Effeminate Words*; according to the Verſe;

Each Bird ſo ſings, as formed is his Bill;
And ſuch as is the Man, ſo ſpeak he will.

Indeed I would willingly have publiſhed more Examples, of the Method of ſwiftly fixing *Sulphur*, but I am kept back by very weighty Reaſons. Yet I cannot chuſe, but Commemorate theſe few things thereabout; *viz.* that every ♁, without the help of external Fire, by a Secret inviſible Fire only, which is added to the combuſtible ♁, and left with it for a ſmall ſpace of Time, in a cold place, becomes as white and fixed, ſuſtaining all force of Fire, as well as that Fixation, which is made by *Aqua Fortis*, or his abſtraction from the ♁. Wherefore this cold Fixation of *Sulphur*, by our Secret cold, and humid Fire (becauſe it needs no common Fire, no Body, and Head, no Retort with its *Receiver*, and the like) is to be preferred before the other Fixation by *Aqua Fortis*. Therefore for this, we give Immortal Praiſes and Thanks to the moſt wiſe GOD.

If any Reader thinks, I have been too brief, or too obſcure in this Treatiſe, he may more amply ſatisfie his Deſires from the two following Tracts, where we treat of the *Mercury* and *Salt* of Philoſophers; whereunto we refer every one, that is a ſtudious Inquiſitor of Art.

OF THE

MERCURY of Philoſophers.

MERCURY may eaſily be extracted not only from all Metals and Minerals, but alſo from Animals, and Vegetable Subjects, and of the ſame (by the help of Gold) be prepared a true Tincture for all the three Kingdoms.

We, from the Conſent of all true Philoſophers, do certainly know, that ☿ is the moſt pure part of the three Principles of Metals, and therefore doth ſpontaneouſly adhere to moſt pure Metals, and always embraceth them with greater affection, than the impure Metals. As for Example, *Mercury* moſt willingly adheres to its own like ☿; next to ☉; then to ☽; afterwards to ♃, and ♄; and laſtly to ♀; but to ♂ moſt unwillingly, only becauſe it chooſeth rather to mix it ſelf with its like, than with its unlike. For it is wholly Homogeneal, void of all Heterogeneal parts; ſuch alſo are ☉ and ☽. The greateſt part of all other Metals is Heterogeneal, although there is found no imperfect Metal, which hath not in it ſelf ſome part Homogeneal; yet ſo, as the Metal participates more of the one, than of the other; according to the Writings of Philoſophers. Wherefore, a true Philoſopher will ſcarcely affirm, that, by the benefit of the Tincture, the whole Body of imperfect Metals can be tranſmuted into ☉ or ☽, ſince ſo great Virtue is not inſited, even in the Philoſophers Stone it ſelf. For the immature, foul, ſtinking, combuſtible and ſuperfluous ♁ of ♃, ♂ or ♀, cannot, in ſo ſhort time, as Projection is wont to be made in, be converted into ☉, although you caſt in more than enough of the Tincture: But as much as the Metal hath of Homogeneity, that is, of *Mercury*, in it ſelf, ſo much only is tinged and fixed into Gold, the Reſidue not ſo. Becauſe the Stone ſeparates the Heterogeneal parts, that is, the ſuperfluous ♁ burning it ſelf (in the form of *Scoria*) from the *Mercury*, which it only tingeth into Gold; becauſe it hath no Communion with thoſe Heterogeneities; as I have daily found, and in the following Part, where we treat of the *Salt* of Philoſophers, I purpoſe to demonſtrate more at large.

Now let us ſee the Method, by which Metallick ☿ may with little Labour be extracted, not only from

Metals

Metals and Minerals; but alſo from all Animals and Vegetables. I ſaid, *With little Labour*, in reſpect of experienced Men. For in reſpect of the Unskilful, it is not a Work of ſmall Labour; but in the Memory of all Ages it hath been accounted (by all the moſt experienced *Lovers* of our *Art*) the *Secret of Secrets*, and the neareſt way to come to the Attaintment of the true *Univerſal Medicine*. Nor will it ever be of leſs Eſteem, ſince in the whole Nature of things, a more pure matter cannot be found, (whereof to make the Stone of Philoſophers) than this only *Mercury* of Metals. In the mean while, it is eaſie to judge, that the *Mercuries* of Metals differ in themſelves notably, and that one of them is better, and more conducible than another, for preparing thence a Tincture for Humane and Metalline Bodies. For one is always better in Colour and Tincture than another. Indeed, by the external Face, almoſt no Man is able certainly to know, from what Metal or Mineral the beſt *Mercury* may be had: Yet according to the general Opinion of Philoſophers, the moſt excellent ☿ is wont to be prepared of the *Vitriol* of ♂ and ♀; becauſe theſe two Metals do moſt abound with Tinctures. I, being taught by Experience, am aſſured, that out of black Aſh-coloured ♄ may be acquired a ☿, as excellently tinged, as from both thoſe Red Metals, ♂ and ♀. Yet in the mean while I do not deny, that the ☿ of ♂ and ♀, is impregnated with ♃, tinging in the higheſt degree; as Ancient Philoſophers, in theſe few words, have compendiouſly expreſſed. *Viſitaris Interiora Terræ, Rectificando Invenies Occultum Lapidem, Veram Medicinam.* By which Words, *VITRIOLUM* [or *Vitriol*] is expreſſed; which proceſs is no other, than a Solution of *Mars* and *Venus* prepared by the Labour of Nature. But *Vitriol* prepared thus by Nature, is never found ſo pure and clean, as that which is prepared of good Steel, and pure ♀, by the help of Oyl of *Sulphur*, or inſtead of that, Oyl of *Vitriol*: Becauſe the Native contains more Earthineſs, than that which is made by Art. Now let us return to our *Mercury*.

VITRIOLUM.

I think good here, to adviſe all the Lovers of our Art, not to bend their thoughts ſo much upon vulgar ☉ and ☽, as to endeavour out of them to extract their ☿ and ♃. Becauſe common ☉ and ☽ are altogether Homogeneal, and have nothing of Heterogeneity in them; and therefore difficult to be wrought on. And although they were as eaſie to be wrought on as ♂ and ♀; yet it would be no Profit to uſe them; becauſe of their greater Price, and alſo becauſe there is much more Tincture contained in vile and contemptible ♂, than in ☉ it ſelf. It is true, this Tincture is not yet fixed, but is volatile, and may eaſily be fixed. Wherefore I adviſe every one to ſeek ☿ in ♄, and ♃ in ♂. Upon ☉, in times paſt, through my Ignorance, I conſumed much without any Profit, and laboured Fruitleſly, until I had conſumed ſome Pounds of it, to find out for others a more ſafe Way; which if any one had ſhewed me, I would never have laboured in vain. But I was hard to believe, that they, who were unwilling to uſe common ☉ and ☽, could prepare an apt Tincture, for tinging imperfect Metals into Gold. Yet ſince vulgar ☉ and ☽, do not only give eaſie Ingreſs to thoſe Tinctures, which draw their Original from the ♃ and ☿ of Philoſophers; but do alſo further the Fixation of volatile *Mercury*; therefore we cannot well be without them, in the Compoſition of the Stone of Philoſophers. Let the Lovers of Art take Cognizance of theſe few things for their Information.

Now it is neceſſary to be known, by what Method the ☿ of Philoſophers may moſt commodiouſly be extracted from Metals and Minerals, and by the help of ☉, be duly fixed by Art, into a Tincture for humane and metallick Bodies.

Firſt, we are not ignorant, that the pureſt part of Metals, *viz*: Homogeneal *Mercury*, is tyrannically held Captive in a certain obſcure Priſon, by his moſt inveterate Enemy, ſuperfluous burning *Sulphur*. Therefore, if any one would unbolt his Chains, and ſet him free, he hath neceſſity to mortifie and annihilate his Enemies, by which he is ſo faſt bound and impriſoned, before he breaks down the Priſon Walls, and delivers *Mercury* from Captivity: Which ☿ will alſo bring forth with him his natural Brother, *viz.* tinging ♃. Theſe being at Liberty, nothing will be wanting to fix them into a Tincture, but the help of vulgar ☉. But if any one be not ſatisfied with this ſhort Paraphraſe, let him read either *Sandivogius*, who hath writ an intire Treatiſe of ſuch a freeing of Captives; or *Paracelſus*, who, no leſs eminently than plainly, hath diſcovered his mind touching the ſame.

Now follows my own Experience, Way and Method, by which I have ſeveral times freed the forementioned Captive, and ſet him at Liberty.

Although I have my ſelf extracted the *Mercury* of Philoſophers from Metals, by ſuch divers Methods, as I mean here to diſcover; yet I always found ſome better than other ſome. Therefore out of ſuch Proceſſes, ſome of which we here ſubjoyn, every Man may, as beſt pleaſeth him, take which he thinks moſt conducible, and proceed in Operating according to that, until he finds, what GOD ſhall be pleaſed to beſtow on him.

Mercury is never to be extracted from hard Metals, before they be diſſolved and unlocked. Unlocked more commodiouſly they cannot be, than by the Corroſive Spirits of Salt. Yet ſince all Corroſives are moſt inimical to ☿, they have no Power of making either Living or Running *Mercury*. Therefore, after Solution, the Corroſives muſt be mortified by contrary Salts; ſuch are, Salt of *Tartar*, Spirit of *Urine*, *Sal Armoniack*, &c. This being done, the Corroſives changing their Nature wax gentle, and in Diſtillation permit the ☿ to aſcend: Which otherwiſe, without Mortification of the Corroſive, would not happen, as you will learn by the following Proceſſes.

Therefore, ſince it is moſt certain, that Metals are to be diſſolved, before ☿ (by the help of Reſuſcitating Salts) can be diſtilled thence; we will firſt exhibit the Method, by which ☿ may be extracted from ſuch Metals, as Nature preſents to us already diſſolved; *viz. Vitriol*, which is no other then *Mars* or *Venus*, or ♂ and ♀ together, diſſolved by the Univerſal Acidity. Hence, whoſoever will uſe (in his intended Work) ſuch *Vitriol*, in which both thoſe Metals are found highly tinged and diſſolved by Nature; he will not need by tedious Labours to ſeek out a new Method of diſſolving Metals, but may ſpare both his Time and Charges. Therefore, now it will be expedient to teach, how *Mercury* may be prepared of any common *Vitriol*.

The Proceſs follows.

Diſtil from common *Vitriol*, in the uſual manner, an Acid Spirit, and fiery Oyl, with ſtrong fire, according to Art. For in the Spirit is latent the ☿ of ♂ and

and ☿, which by Mortifying the Corroſive, may be brought to light, and made Viſible as follows.

℞. Of *Tartar* calcined unto Whiteneſs ℔ i, or ij, which reduced to Powder, put into a Glaſs Body, on which ſet an Head with its Hole and Tunnel in it, well luted; then apply a Receiver, and lute the Junctures exactly. When the Body and Head is placed in warm Sand, through the Tunnel, at one time pour on about one or two *Lotones* of the ſharp Spirit of *Vitriol*, upon the *Tartar* calcined; whence will be cauſed ſo great Ebullition, as by its own proper Power the Spirit will aſcend from it. This Duel or Fermentation being ended, again pour in ſome Ounces of that Spirit; which alſo leave, till all the Ebullition ceaſeth. Afterward reiterate the like injection, until that Acidity contends no more with the *Tartar*: Which will be an Argument, that the Salt of *Tartar* is ſufficiently mortified. When you ſee this, adminiſter Fire, and by Degrees draw forth all Humidities, unill the Veſſel and Matter is Red hot. The Water that aſcended (which in Taſte will be almoſt like Spirit of *Urine*) muſt be rectified; in which Rectification the ☿ of the *Vitriol* aſcending, is rendred more ſubtile and more pure. This pure *Mecurial* Water bears in it ſelf inviſibly contained, a living Metallick *Mercury*, which is made conſpicuous thus,

The Conjunction of Philoſophick Mercury *with Gold.*

Diſſolve common ☉ in a ſharp *Aqua Regis*, and ſeparate the diſſolved from the undiſſolved. Then leiſurely, and at times, drop after drop, pour of your ſubtile Mercurial Water upon the Solution of ☉, ſo long, as until the Spirit of the *Mercury* hath no more Action upon the Solution of Gold, but ceaſeth, and all the ☉ ſhall be precipitated from the Water. In which Precipitation, the ☉ attracts to its ſelf the *Mercury* of the *Vitriol*, from the Mercurial Water, in ſuch a manner, as it ſettles to the bottom of the Veſſel, in the form of Slime, or a yellow Powder. Let the Precipitate be filtred through brown Paper, that the *Saline* Water may paſs through; and the precipitate ☿ remain in the Filter mixt with the Gold; which muſt be very well waſhed with ſweet Water, and, being edulcorated, dryed. This being done, you will have the ☿ of *Vitriol* united with the ☉: Both which will ſuffer themſelves to be fixed into a true Tincture, for Humane and Metallick Bodies, as follows.

The Fixation of Mercury *with Gold.*

Note: Before the *Mercury* is put in to be fixed with the Gold, it muſt be proved, whether it be duly prepared, or not. For if the Mercurial Water was rightly prepared, it will contribute *Mercury* enough to the Gold; by which ☿ the precipitated Gold is ſo augmented, as tis no more common ☉. But if the Mercurial Water was not legitimately prepared, and conſequently could not contribute much ☿ to the ☉, the Gold will remain poor, and, as ſoon as it is ſenſible of any heat, will fulminate, like any other fulminating Gold, and ſo be altogether unfit for Fixation, being deſtitute of a tinging ☿, which ſhould have converted the whole Body of ☉ into Tincture. Wherefore, after Precipitation of the ☉ and ☿, you muſt make a ſmall part of the Precipitate hot, in a very ſmall Crucible, for Tryal, whether it be fit to be fixed. For if it fulminates, like fulminating ☉, it is a ſign your Mercurial Water was not perfect, and could not give unto the Gold ☿ enough. But if after it ſhall be Red hot in the Fire, it comes forth with a delicate purple Colour, it is to be ſuppoſed, the ☉ hath imbibed ☿ enough, and they both be fixed together into one Tincture.

Note: Beware of too ſtrong a Fire. For this way the *Mercury* will leave the Gold untouched, and fly away; ſo as, thence you can have no certain Tryal. Therefore, in all parts of the Work proceed Warily and Prudently. The Fixation of ☿ with ☉ is thus made:

The Fixation of the Mercury *of* ♂ *and* ♀, *into one Tincture.*

℞. So much as you have ready prepared of this our *Mercury* impregnated with Gold, although there be no more of it, than half a *Loton*: For here no great quantity is deſired. Put it into a ſmall Glaſs Phial, which place in hot Sand; yet take heed, you give no ſtronger Fire, than your Volatile Bird can bear. This Fire you muſt continue in a moderate degree for ſome Weeks: For by that means, your *Mecury* will by little and little, be able to brook the Fire, adhere to the Gold, and convert the ſame into Tincture. But if any one, contrary to the ſerious Interdiction of all Philoſophers, make too much haſte, and perſuade himſelf, he may in a ſhorter ſpace of time acquire the Tincture; his *Mercury* will fly away, and leave the Gold pale behind it; becauſe the ☿ in its flight ſubſtracts the Colour of the ☉, and carries it away with it ſelf. Therefore, in Fixing there is need of Patience. Hence all Philoſophers adviſe, not to be haſty. For Feſtination proceeds from the Devil. Wherefore, let every one ſo far ſtudy his own Good, as to be obedient to this Admonition.

Note: There are alſo other ways, or Methods, of fixing ☿ with ☉; but he doth very fooliſhly, who, when no neceſſity urgeth, will proſtrate all things together and at once, at the feet of Swine. Whomſoever GOD will be pleaſed to aſſiſt, he may triumph in the higheſt help; but whom GOD doth not aſſiſt, even the moſt plainly preſcribed Method cannot help him. For all our help depends on the divine Bleſſing.

How to prove, whether Mercury *be Legitimately prepared, and whether it can give forth the Tincture of Metals.*

℞. Of the Mercurial Water above deſcribed, and mortifie it by a contrary Acidity, as Oyl of *Vitriol*, or Spirit of *Salt*. Then the *Mercury* will precipitate it ſelf, in the form of an Aſh-coloured Powder, which if you edulcorate, and grind with Oyl of *Tartar*, you will vivifie. If any one be minded, he may alſo diſtil the ſame by Retort, and ſo examine it.

A Tryal, or Proof, whether the Mercury *of Metals be ſo well prepared, as of it with* ☉ *may be made a Tincture.*

℞. A little of that, *viz.* the quantity of a Pea, and put it upon a Silver Plate, then over the Fire permit the *Mercury* to be evaporated. If it tinge the Silver well with a purple Colour, it is fit for the Work, otherwiſe it will be of no Value. Alſo, this ☿ may be digeſted with the filings of ☉, in a due meaſure or proportion mixed, and ſo fixed. But this Fixation, as well as the former, require a long time, and ſo much Patience, as all Feſtination muſt be laid aſide. Whoſoever is ſo covetous, as he cannot wait till the Fruits are Ripe; he would be better adviſed, if he abſtained from ſo great a Work, than to ſet about it to his own

Damage. I have often prepared this *Mercury*, and put it to be fixed; but becauſe I could not look to it my ſelf with my own Eyes, I was conſtrained to commit the Governance of the Fire, to the Induſtry of another, and then it ſucceeded unhappily. And when by reaſon of my Age, and imbecillity of Body, I was wholly uncapable to take in hand a Work of ſo great moment, I communicated the Method to ſome of my intimate Friends, with this Condition, *viz.* that they ſhould elaborate it themſelves. But becauſe in that Operation, they could not acquire ſo much ☿ as they deſired, they deſiſted, and would not proceed to the Compleatment of the Work. Hence I was moved rather, by Printing, to divulge ſo Royal a Work, than to let it be buried with me: Although I was difficultly brought to an hearty Aſſent, to yeild to the Revelation of *Arcanum's*, of ſo great moment, to this Malignant and unfaithful World.

The way of Preparing a tinging Mercury *out of* Antimony.

℞. Of *Antimony*, *Saltpeter*, and *Tartar*, of each ℔ j. Which, firſt pulverized and mixed, put into a Crucible, and kindle the Mixture with a Coal; when the Fulmination ceaſeth, melt it, and pour it out into a Cone. After it is cooled, ſeparate the *Regulus* from the *Scoria's*; which reduce to Powder, and diſſolve by boyling in Water. So doing, you will have a Red *Lixivium*; upon which if you add (about half its own weight of) *Salarmoniack* pulverized, and put the Mixture into a Glaſs Body, (which muſt not be above half full, becauſe it riſeth eaſily) with it's Head and Receiver well luted, and then ſubminiſter Fire for Diſtillation; a certain moſt ſubtile volatile Spirit will aſcend, in which the ☿ of *Antimony* is latent: Which, in a Solution of ☉ may be precipitated, edulcorated, dryed, and then proved and fixed, as above we taught of the *Mercury* of *Vitriol*. *Antimony* yeilds much more ☿, than *Vitriol*; and it is alſo made more eaſily than it; and therefore to be preferred far before it; but eſpecially, becauſe the Ancient Philoſophers did for the moſt part uſe this ☿ of *Antimony*, for preparing their Tincture.

Note: If any one deſire a more excellent ☿ of *Vitriol*, than That above deſcribed by Us; he, inſtead of the *Lixivium* of *Antimony*, may uſe a *Lixivium* of *Salt* of *Tartar*, and thence extract *Mercury* by the help of Oyl of *Vitriol*; ſo he will have ſome thing more excellent, than can be made of a Common *Lixiuium*.

The way of Preparing out of ♂ *and* ♀ *a tinging* Mercury, *by the help of Reſuſcitative Salts only, without any Corroſives.*

Among all Reſuſcitative Salts, *Tartar* obtains the principal place; the next to which is Salt of *Urine*, which is no other, than ſuch a Volatile *Tartar* as paſſeth into this kind of Salt, from Wine, Beer, Bread and other Foods taken into the humane Body. Almoſt of the ſame kind, is the Soot of Chimneys, being the Volatile Salt of Wood. Alſo a like Volatile Salt you ſhall find in Blood, Hairs, Horns and Hoofs of Animals. Even ſo, almoſt a like *Salarmoniack* is prepared of Blood, Urine and Soot. In like manner, in Eggſhels is inſited an efficacious Reſuſcitative Salt. Theſe and the like Salts are endued with a Virtue converting Metals into *Mercury*, after they are diſſolved. For volatile Salts are not ſo efficacious, as to diſſolve Metals: Yet *Tartar* is endued with ſo great Power, as it can diſſolve ſome Metals eaſie to be diſſolved, as ♂, ♀ and ♄, and thence may the *Mercury* be extracted by Diſtillation; eſpecially if a little Kitchin Salt be added, or (which is more conducent) *Salarmoniack*, to comfort it. Alſo inſtead of ♂ and ♀, common *Vitriol* only may be uſed; and thence *Mercury* diſtilled by the help of volatile Salts.

Now follows the Proceſs.

℞. ℔ vj. Of *Vitriol*, to which, diſſolved in Urine, add of *Salarmoniack* ℔ j. Crude *Tartar* ℔ ij. Salt of *Tartar* ℔ iiij. Diſtil from theſe, in a ſtrong Glaſs Body, a ſubtile Mercurial Water; which, according to the Method preſcribed, may be made Corporeal, and with Gold be fixed into a Tincture. This way of proceeding is very eaſie, and of little Charge; ſo as it will fully ſatisfie the deſire of thoſe, who are contented with ſo much only, as may be acquired by the benefit of Glaſs Bodies. But thoſe, whoſe greedy deſire cannot be ſatisfied with little, may diſtill this Mixture in a Braſs or Copper *Veſica*, untill they have quantity enough to ſuffice them: Yet with this Caution, that they uſe no *Alembick*, or *Refrigeratory* made of Copper, but of Lead, or (which is better) of Tin; and that becauſe our Mercurial Water eaſily corrodes the Copper, and thence contracts to it ſelf a Greenneſs: But in ♄ or ♃ doth not ſo. But if any one refuſeth to be at the Charge of a Tin *Refrigeratory*, he may uſe his Copper Veſſels. For although the Spirit corrodes the Copper, and contracts a blewiſh Colour, yet this Colour in Rectifying abides in the bottom, and the ☿ is nothing the worſe. Indeed, this way a greater quantity is acquired, than needs; unleſs the Operator be more greedy than a Wolf. But it is not the part of a good Philoſopher, to covet more than is needful. If any one be deſirous to prepare an abundance of Mercurial Water, either by ſome ſuch way as this, or by another certain Mixture of Salts, him we have now, as it were, led by the hand, through Proceſſes more difficult, to proceed in theſe. For *Tartar* alone will be ſufficient for ſuch an Uſe. What ſeek you? The Feces of Wine burnt will do the ſame; ſo as the Lover of Art, with almoſt no other Trouble and Charge, may extract the *Mercury* of Metals by Reſuſcitative Salts.

The way of Preparing Mercury *out of Metals and Minerals, by the benefit of* Tartar *only, without any other Salts.*

℞. Filings of Steel ℔ j. *Tartar* ℔ ij. Common Water ℔ xx. If by ſtrong boyling by *Alembick* in Sand, you diſtil thence all the Water; the *Tartar* in that boyling diſſolves the ♂, and ſo will Volatilize the *Mercury* ſet at Liberty, in ſuch wiſe, as it will aſcend with the Water, like a ſubtile Spirit; which, (concentrated and made fit by Rectification) either by a Solution of ☉, or by ſome other contrary Acidity, is rendred Corporeal, according to the Method above ſhewed. If any one, to as much *Tartar* as he hath, take half ſo much *Salarmoniack*, the *Tartar* ſo much the more readily preys upon the ☿, alſo much more *Mercury* iſſueth thence, than by *Tartar* only.

Note: But ſince this way, in one Diſtillation, but little *Mercury* aſcends, ſuch an Operation may be performed in a large *Veſica*; yet with this Caution, *viz.* that the *Alembeck* and *Refrigeratory* be not made of Copper, but of Tin or Lead. This way of Operating by a *Veſica* will be of great uſe, eſpecially for ſuch covetous Men, as cannot be content with few things; but

but always labour with the perpetual Poverty of an unsatiable Spirit; although, they more than sufficiently abound with the fulness of all desireable things. For he is only Rich, who is always content with his present Fortune.

The way of Preparing Mercury *of* Saturn, *by* Tartar *only.*

℞. One or two ℔. of the Raspings or Filings of *Saturn*, upon which pour fifteen, or twenty ℔. of strong Vinegar of Wine, and mix therewith a little pulverized *Tartar*. But the Vinegat *per se* should be impregnated with no small quantity of *Tartar*. Which *Tartar*, if you distil with the Mixture, the Phlegm in Distillation carries over with it self a subtile Mercurial Spirit; which must be separated from the Phlegm, in manner as we above taught. The Solution of ♄ will remain in the bottom. Thence also, by the help of Salt of *Tartar*, ☿ may be extracted by Retort; yet it is not so good as the other, which ascended in the form of a subtile Spirit.

The way of Preparing Mercury *of* Antimony, *by the help of* Tartar *only.*

℞. Some Pounds of strong *Antimonial* Red *Lixivium*, (made of *Antimony* duly, decrepitate and melted with *Tartar* and *Nitre*) which put into a Glass Body set in Sand, as we above taught, in treating of the Fixation of ♃: Afterward, through the Tunnel, leisurely and at times, pour upon the *Lixivium* most strong Wine Vinegar, until both (*viz.* the *Lixivium* and Vinegar) cease to Act upon each other. This being done, if by Distillation you separate all the Humidity, the Sulphureous Spirit of *Antimony*, will ascend in the form of a subtil Spirit, smelling like *Sulphur*: Which after Rectification, either with a Solution of ☽ or ☉, becomes Corporeal, and so habile, as it may be converted into a fixed Tincture.

The Method of Distilling a tinging Mercurial Spirit from Metals another way.

We above shewed, that from Metals most firmly compact, a tinging ♃ and ☿ could not be extracted, unless the Metals be first dissolved, or mortified; and that in such Mortification, there is a Spirit so apt to be associated, as, in the very hour of Mortification, it lays hold of, and carries up with it self, the ascending Spirit, or Soul of Metals. Yet among all, pure Spirit of Wine well dephlegmated, I judge best; because in abstraction it carries over with it self the most pure ♃, and ☿ of Metals, and leaves the Gross dead Body behind in the bottom; so as, such *Mercury*, as you shall draw forth in distilling by Spirit of Wine, will be much purer, and more Virtuous in Tinging, than the other, which you distil off by common Water only; and that for this especially, *viz.* because this Spirit, which is extracted by Spirit of Wine, from more pure is rendred most pure by Rectification. Which is a thing impossible to be effected, where the Sulphureous ☿ of Metals shall ascend by the help of common Water; because then the Water only, in Rectification, is distilled off, but the ♃ remains in the bottom, in form of a Red Powder: And the other, which is sublimed by Spirit of Wine, and afterward by Rectification subtilized to an higher degree, and meliorated in its tinging Virtue, is not only in *Medicine*, but also in the Melioration of Metals, Gems, and the more ignoble pretious Stones, an hundred fold more efficaciously conducent to tinge them to a Constancy, than the former, which, in distilling, ascends by Water only; and by Rectification cannot be exalted, or multiplyed in its Virtue, so well as the other, made by Spirit of Wine. That Sulphureous ☿, which ascends by help of Spirit of Wine, is endued with so subtil and penetrative Power, as to it in the Vessel is given such Ingress, by which Metals and Gems are tinged with a more constant and durable Red, or Yellow Colour, than can be annihilated or impaired by any Corrosive Waters, or by the violence of Fire; especially if it be distilled from apt tinging Subjects, as the *Vitriol* of ♂ and ♀, or from *Antimony*. Of which I suppose enough is now spoken.

Therefore, if any one be desirous of knowing more touching this Matter, him (for his further and more clear Information of the same) I refer to the Seventh Part of our *Spagyrick Pharmacopœa*; where he will find, we have prolixly taught, touching the extraction of Tinctures, from Red Corals, and other tinging Subjects.

The way of making good Mercury of Saturn *and* Luna.

℞. Of ♄, or ☽, ℔j. which, dissolved in *Aqua Fortis*, precipitate with Salt-water, edulcorate the Calx with Sweet-water, and dry it. When dryed, mix with it a fourth part of our ♃ fixed unto Whiteness. Distil from the Mixture in a coated Retort its ☿ with strong Fire; which notwithstanding will not be living ☿, but, in the form of a Sublimate, will adhere to the Neck of the Retort, in weight heavy, and to the Taste of the Tongue very sharp. Indeed there will not be so great a quantity of it, as some may desire, yet it is worthy of the highest Estimation. For in a Cold Cellar it is easily dissolved, and becomes a strong Mercurial Water, which dissolves all Metals. This Water prepared of ♄ joyns it self (with an incredible Love) with the Soul of ♂; and suffers it self to be fixed with it into Tincture; This Water prepared of ☽ readily dissolves Gold, and with it passeth into Tincture. The Reason, why, I in Distillation, mix fixed ♃ with the ♄ or ☽, is this: Since both these Subjects, precipitated, as we above mention, with Salt-water, are very fusile and penetrating, easily melt together into one, and in Distillation yeild no ☿. Nor can Sand or Earth prevent this Fluxion. Wherefore, I could find nothing more conducible, than our white fixed *Sulphur*.

The way of Preparing Mercury *of* Jupiter.

Jupiter gives forth from it self, a most excellent *Mercury*, in form of a subtil Spirit; which, above all other *Mercuries*, is most earnestly beloved and attracted by Gold. For if but a very small quantity of it be put into any Solution of Gold, it in a moment draws to it self all the Gold from the sharp *Aqua Regis*, and together with it settles to the bottom, like a purple Powder. This is the best Precipitation of ☉, when you shall extract it with *Aqua Regis* from Sand and Stones: Because, by this Precipitation, the *Aqua Regis* may be used again for extracting ☉ from Sand and Stones, as you may more amply read in our Seventh Part of the Prosperity of *Germany*, where we have plainly writ touching this kind of Extraction. But in another manner, may be prepared as powerful a Mercurial Water from all Metals, by the help of my Secret *Sal Armoniack*,

niack, which, by *Paracelſus* and *Helmont*, is called the Liquor *Alcabeſts* touching which, I have largely treated in the Seventh Part of my *Spagyrick Pharmacopæa*, where he who loves ſo great Gifts of GOD, may ſatisfie his Appetite to the full.

Behold, I preſent thee another way, by which, without any Charge or Expenſe of Money, you may eaſily prepare as much of the Philoſophick ☿, *as you will.*

I would not have you to ſuppoſe, I hree inſert this ſo ſtinking a Proceſs, to the end you ſhould follow this, rather than the before-mentioned; but I add this, that the common ſort of Men, ſimple and poor, may ſee, that they may, by ſuch a Method as this, ſuppreſs their Poverty, and attain to the Acquiſition of ſo noble an univerſal *Medicine*, as well as any other of the great and mighty Men of the World, by their ample Fortunes.

Whoſoever is but a little Skilled in *Chymiſtry*, well knows, that every ♃ and ☿ ariſe from one only Original; and that the *Sulphur* in Herbs, and alſo that in Animals, is of no leſs Virtue, than the other in Metals, Fixation only excepted. For as this in Metals is found more fixed than that in Minerals, ſo the Mineral ♃ is more fixed than the Animal, and Vegetable. The ſame is to be judged of *Mercury*. But that we may wander no further, but return again to our Purpoſe, and clearly preſcribe the Method of *Preparing an univerſal Medicine, of Humane Urine and Dung*, I will very briefly diſcover the Proceſs in theſe following Words.

℞. A good quantity of humane Dung and Urine, collected in ſome capacious Veſſel, and (after they have ſtood together about a Month, and when the *Salt* ſhall be exactly united with the *Sulphur*, and *Mercury* by Fermentation) from thence, by an *Alembick* in *Balneo*, diſtil the Mercurial Sulphureous Spirit; which indeed will be very ſubtil, but ſmell ſtrong. Yet after Rectification, as we have taught, it may be conjoyned with a Solution of Gold, and, by moderate heat, be gradually fixed into an univerſal *Medicine*, for Humane and Metallick Bodies.

Note: The aforeſaid Stink vaniſheth ſo ſoon as the *Aqua Regis* hath Acceſs. Wherefore, thoſe Philoſophers, who have laboured in Matters of evil and ſtrong Smells, did always ſpeak of ſuffocating their venemous Dragon in *Stygian* Waters. But among all Philoſophers, that ever I read, I find no Man more excellently to have writ, touching this matter, than the *Philoſopher Neuſementius*, in a certain ſmall Treatiſe of his, intituled, *Of the Salt and Spirit of the World*; where he ſo explains the Table of *Hermes*, as he renders it moſt worthy to be Read; becauſe he hath ſo very prolixly, and largely, with exquiſit ſtudy and diligence, explained all things whatſoever, the laudable *Hermes*, in very few Words, left to Poſterity in his *Smaragdine* Table.

A COROLLARY.

ALthough I have, in this ſmall Tract, ſo largely and clearly treated of Preparing the *Mercury* of Philoſophers, as it ſeems altogether needleſs to trouble the Reader, with a further Paraphraſe; ſince from him, I have not concealed any Methods of manual Operation, but have ſo revealed all things neceſſary to be known, as he (who, only ſeeking the bare Letter of the preſcribed Method, knows not how to elaborate his own intended Work) may rather be accounted a Man of a dull Capacity, than a Chymical Operator: Yet ſince unto all inſatiable Sons of Avarice, according to this my Deſcription, there ſeems to be too ſmall a part of *Mercury* extracted, I (for the ſake of thoſe alſo) will demonſtrate yet another Method, by which they may obtain a larger quantity of good tinging ☿, than from Metals can be gained. But firſt it is required, that every one, who will exerciſe himſelf in this kind of Labour, ſhould ſhew himſelf a diligent Operator, ſhunning no Pains: Know, that Vulgar *Mercury* may eaſily be ſo prepared by Art, as to be as much conducent for Tinging, as the *Mercury* of Metals. Yet they muſt firſt procure Tincture to it, by tinging Metals, as by ♂, ♀ and *Antimony*. For, of its own proper Nature, it hath no Tincture at all in it ſelf; but it muſt neceſſarily receive the ſame from other Metals, (in which GOD and Nature co-operating have inſited it) before it, can exerciſe the Power and Faculty of Tinging. But which way ſuch a Tincture may commodiouſly be taken, and acquired from certain Stones tinged by Nature, or from certain Metallick, and Mineral Subjects, hath been by me, in various places of my Writings, ſo frequently mentioned, as I judge it not neceſſary to Diſcourſe further thereabout in this place. But here, I will freely expoſe to publick view the way of Preparing vulgar ☿ ſo, as it may be able to extract Tinctures from Metals, Minerals and Stones.

℞. Common *Mercury* ℔ j. Which as ſoon as you have diſſolved in *Aqua Fortis*, mortifie the *Aqua Fortis* by pouring on Spirit of *Urine*, and when you ſhall by Retort, in hot Sand, have abſtracted thence all the unprofitable Water, and adminiſtred a ſtronger Fire, the *Mercury* will ſublime it ſelf in the Neck of the Retort, white in Colour, but diſcovering no ſingular *Acrimony* upon the Tongue. Such a ſublimate as this, is eaſily diſſolved by help of common Water. This *Mercurial Water* is endued with a power of extracting Tinctures from Metals, Gems, and other more ignoble Stones. In which very Work, even *Proſerpina*, the Wife of *Pluto*, will ſcarce elaborate any thing more excellent: Therefore, when this ☿ hath drawn ſo much Blood from the *Red Lyon*, as it no longer remains White, but becomes totally Red; then indeed it hath acquired the Melioration of one higher degree; but as yet, it is able to work no Miracles in Tinging. Now, that it may be exalted to ſo great Perfection, as to be admirably efficacious in Tranſmutation; this Red *Mercury* muſt again be vivified, and again (as we taught above) mortified; and if this Labour be repeated ſeven, nine, or twelve times, it will be ſufficiently impregnated with Tincture. This being done, you have nothing elſe to do, but to fix this tinging *Mercury* into a fuſile Red Stone, which will thenceforth perform the ſame (yea perhaps more) in the Tranſmutation of Metals, than the *Mercury* of Metals it ſelf.

Although, I have here revealed the Melioration of common *Mercury*; yet, I am fully perſuaded, no Man will readily ſet himſelf about its Preparation, nor adventure, by Tryal, to experience the truth of this. For commonly, every good thing is diſeſteemed, if it want external Splendor. Some years ago, I did earneſtly, and highly commend to ſome of my moſt loving Friends, the Exaltation of common *Mercury*; yet no one of them took ſo much notice thereof, as ever to

ſet

ſet his hand to the Work. Wherefore no Man needs to fear, that Art will be made too common, although I had publiſhed the ſame, deſcribed even with a *Solar Ray*. Indeed, I intended to have divulged more touching ſuch ſublimate *Mercury*, as may be diſſolved with common Water, *viz.* how many other famous Works may be performed with it, beſides the Tranſmutation of Metals; but for brevity ſake, I here deſiſt at preſent: Yet after a little while, (if GOD permit) I will elſewhere treat of the ſame. In the mean time, let the loving Reader kindly accept of theſe; For hence he may be aſſured of the poſſibility of exalting common ☿ ſo far, as to be equal in Virtue to the *Mercury* of Metals: In which Aſſertion every ſtudious Artiſt may ſafely confide, and perſuade himſelf, that I here give no other Teſtimony, than I have learned by my own Experience oftentimes.

OF THE

Salt of PHILOSOPHERS.

How, and whence, That is Prepared, and of what uſe It is in Medicine *and* Chymiſtry.

THoſe our venerable Anceſtors, the ancient Philoſophers, have indeed copiouſly written many things, touching this Third Part of the Principle of Metals, *viz. Salt*: Yet ſo very obſcurely, as it is almoſt impoſſible for a Man to learn thence, Fundamentally, any thing of moment: Yea, I might ſay, it hath happened to very few, to know how, to prepare the *Salt of Philoſophers*, but on the contrary, ſix hundred have ruined themſelves, and loſt all their Fortunes in labouring thereabout. After, I alſo had, for ſome years together, expended great Labour and Coſt, beſides what I ſpent in acquiring both the other Principles, *viz. Sulphur* and *Mercury*, (which were underſtood by me, about two years ſince) it pleaſed the moſt wiſe GOD at length, alſo to reveal to me this moſt famous *Salt*. Wherefore, I could not refrain from communicating ſome thing of it to Poſterity, for the Glory of my GOD, and for divulging his wonderous Works, not doubting, but that this my Revelation may be of great Concern, to open the Eyes of this blind World. Becauſe, they may be helped by ſuch a Salt, of which, ſo incredible Works may be prepared, as I am now about to write, and are already ſufficiently known to me.

I can unto every Man ſafely, ſurely and truly affirm, that whatſoever I here write, are not the idle Dreams of a vain Man, nor patched together out of other Books, but true and ſolid Experiments, which I my ſelf, with the help of theſe my hands, have found out. Indeed, I do not here ſay, that I could give no credit at all to him, who no long time before diſcovered ſomething to me, touching ſuch *Arcanum's*; but I thought his Words intimated Paradoxes and Impoſſibilities; although I had read Philoſophers, who writ: *He that hath the Salt of Metals, hath the Stone of Philoſophers*. I alſo well know, that the *Salts* of *Metals*, according as they been hitherto every where fraudulently preſented by *Pſeudo-Chymiſts*, having no ſolid Foundation, do not indeed deſerve the name of Salts; being no other, than ſuch *Vitriols*, as by the ſharp Spirits of *Salts*, are prepared of Metals; and are not at all efficacious to meliorate any of the more vile Metals. On the contrary, we certainly know, that our more true Salts do ſo amend all imperfect Metals, as great and gainful Fruit may be reaped thence, as by the following ſhall be clearly made appear. But before we write any thing of the Uſe, of this *Royal Salt*, it will be worth while to premiſe ſomething briefly, and truly, touching the Preparation of the ſame.

Of the Preparation of the Salt *of* Philoſophers.

Now, that I may, without any wandring Ambages, deſcribe the Method of Preparing this Salt, which is incomparable and Royal, know in very deed, that this Salt is no other, than common (but rightly prepared) Oyl of *Vitriol*, Coagulated by white fuſible *Sulphur* into a ſweet Salt, which impreſſeth not on the Tongue, the leaſt Saline ſavour; but rather ſeems to be a Stone than Salt, although fuſible, like any other liquid Salt. But how that Oyl of *Vitriol*, or Univerſal Acidity, may be changed into ſuch a wonderful Stone, not Corroſive, I purpoſe not to divulge. It is enough for me poſitively to affirm, it may be done.

Whoſoever deſires to know more of it, let him implore the help of GOD, and peruſe the Writings of Philoſophers, that if he be worthy of this divine Gift, he may be helped; if he be not worthy, I cannot help him. For as I acquired that, not without praying and ſeeking; ſo alſo, muſt every other Man reſolve to do: Becauſe, no Man ſhall ever get more out of me, than what I here have willingly diſcovered for publick Good. Now follows

The incredible Virtue and Efficacy, which this wonderful Salt manifeſts in Preparation of Tinctures, for exalting all Metals and Minerals to the perfection of Gold.

Although it is before ſaid, that Salt, or the Stone of Philoſophers, is only prepared of Acid *Vitriol*; yet I thought it neceſſary alſo, here to publiſh, that Oyl of *Vitriol* may be prepared divers ways, ſo as one or another may prepare it, this way or that way, as he pleaſeth. For the common and vulgarly known Oyl of *Vitriol*, ſuffers it ſelf (by the help of *Sulphur*) to be eaſily tranſmuted into a Sweet Stone: Becauſe *Sul-*

phur alone is endued with Power of edulcorating all Corrosives, and of Coagulating them into such a Stone, or Salt, by the benefit of which, Wonders may be done, both in *Medicine* and *Alchymy*. Philosophers do indeed persuade us, that, out of *Vitriol*, an Oyl of a Blood-Red-Colour may be extracted by Art, with which, White Metals may be tinged into Red: But the way of Preparing this, they described not. This is that, which is most studiously sought by the Adorers of the Chymical Art, but hath hitherto been found by very few; and therefore is generally thought, by almost all Inquisitors, to be impossible, whatsoever Philosophers have writ thereabout, and how clearly, and plainly soever described it. *Basil Valentine* doth, with *Paracelsus*, call this our Oyl of *Vitriol* tinged with a Red Colour, the Blood of the *Green Lyon*; but *Bracesius*, the Wood, or Tree of Life; *Virgil*, a Bough, or Branch, plucked by *Proserpina*'s help from the concealed Tree: Also, *Ovid* useth divers other Expressions, in the Description of this Tincture.

This Red Oyl suffers it self to be Coagulated into a Stone, not Corrosive, as well as the Common Oyl: But this Coagulate is totally Red, and the other is White only. Therefore, there is a necessity, that the difference of both be known. For of both these, what the White is able to do, the Red cannot do; and what the Red can effect, is impossible to be performed by the White. That Red Oyl tingeth white Metallick Bodies into Gold, and so tingeth white Chrystals into Gems of all kind of Colours, (according to the Operators Pleasure) as, in Elegancy, they become altogether like to the Native. But the White tingeth not, because it self wanteth Tincture, which notwithstanding may be procured to it: Yet it extracts the Tinctures from all precious, and more ignoble Stones, and by them is so tinged, as it is, thenceforth able to tinge white Metals into Gold, and white Chrystal into beautiful Stones of every Colour, and that with as excellent Splendor, as their Brother, the Ruby, enjoys. In a Word, our Salt of Metals, or Stone of Philosophers alone, and *per se*, is so great a particular Ruler throughout the whole Kingdom of *Chymistry*, as, by amending, it transmutes all imperfect Metals into Gold, and common Stones into precious: Yet unto it, is denied Ingress into Vulgar ☿. But the fixed ☿ of Metals will abundantly perform that; as is before abovementioned. Now, as touching this *Mercury*, which those imperfect Metals, *viz.* ♄ ♃ ♂ and ♀, contain in themselves, our *Sulphur* is so very fit for tinging that, as, for that purpose, there is no need of other help. Therefore it is most certain, that the Salt of Metals obtains Priority in the Chymical *Laboratory*. One thing I am freely willing to discover, *viz.* this: If any one would take away the fixed Tincture, or tinging Soul from precious Stones, as *Granates*, *Rubies*, *Saphires*, *Lazure* Stones, and other common Stones, and add to them also, a small part of pure Silver, our Magnetick Salt will extract the Tincture from the Stone, and at the same moment, in which it extracts the same, incorporate the added Silver, with the Tincture, and tinge the same into Gold: So, as it will affect a Man with admiration to see, that in one and the same Subject, should be both an attractive and expulsive Virtue. Perhaps hence, that most ancient Philosopher *Pythagoras* drew his Opinion; for he believed such a Transmigration, and taught, that the Soul, as soon as it passed out of the mortal Body of Man, it entred into some other near adjoyning Subject, and there inhabit'd. Indeed they, that labour in Metals and Stones, do find such a Process; but with the Soul breathing out of the Body of Man, the matter is far otherwise. For here Bodies are not required, but Spirits, which at the hour of Death receive the Souls of dying Men, and convey them to Places by GOD appointed. According as the Man hath lived, either Well or Ill, so those Spirits will act at the end of Life, each according to their Office; so as, the Souls of pious Men shall be received by Spirits of Light; but impious Souls, by the Spirits of infernal darkness. In the Mortification of Metals and Minerals, Philosophers also want not their peculiar Spirits, which receive and transport the flying Souls of Metals and Minerals. Touching which Transportation of Souls, we made some mention above, where we treated of the Fixation of Metals. Also * this Traduction was highly esteemed by ancient Philosophers, especially by *Neusementius*, who said: By this Power, *viz.* *By the Spirit and Salt of the World, we deliver the Souls of the Dead from the Prison of Hell.* Therefore, whosoever shall be well Skilled in this kind of operating, he will be able to do Wonders in this Chymical Kingdom of Metals. For if you add the Spirit and Salt of the World to any Metal dissolved, and by Retort distil the Mixture, they will carry over with themselves, the most pure part of the Metal, *viz.* its tinging Soul, and leave nothing behind in Hell with *Pluto*, but the gross and unprofitable Body. Wherefore, whosoever can rightly separate that transduced tinging Spirit of Metals, from the Spirit of the World, he will absolutely be possessed of a fixed Tincture: Because, that strong transporting Spirit doth also fix the volatile Soul of Metals, and render it constant in Fire. And, although that Subject was most volatile, from which the Tincture was distilled by the Salt of the World, as by one only Distillation from common *Sulphur*, *Auripigment*, *Cinnabarine Sulphur*, and the like; yet you will acquire a Tincture, constant in all Fire, not only for Humane and Metallick Bodies, but also for Gems. So very potent Virtue is latent, in these abject Subjects, and in the Spirit and Salt of the World, rejected by the great Troop of proud Men. But the Method of using such Pearls legitimately, for the Transduction of Metals, had need to be Sealed up with the Seal of the laudable Philosopher *Harpocrates*, lest so great a Treasure be cast under the Feet of sordid Swine. Touching a like *Compendium* of fixing Volatile Metals, and Minerals, we (GOD willing) purpose hereafter to teach more at large.

* *Transduction.*

Now, we having generally understood, what our Salt of Philosophers is able to perform in the Transmutation of Metals, I judge it not amiss, to discover; how great, profitable and powerful Faculties, it is also endued with, even besides the Transmutation of Metals. But here, by the way it is to be understood, that our Salt of Philosophers is insignized with many other Names, which ancient Philosophers imposed on it, not without pregnant Reasons. For, according as they beheld the various Wonders they were able to perform by the help of that; so they also gave Names unto it; sometimes, they called it the *Soap of the Wise*; another time, *Hercules* or the *Herculean Key*; sometimes, the *Key of the Philosophers*, &c. and all this by reason of its exceeding great Potency and Virtue, whereby it always rendred it self worthy of one or other of these Names. *Why did they call it, the Soap of the Wise?* Because it renders those Metallick Bodies, which are washed with it, most purely white. Indeed Washer-women have their Soap made of Oyl and *Lixivium*, with which they wash filthy Garments unto White-

Whiteneſs. *Leather-Dreſſers* uſe a kind of Soap to cleanſe their Skins from all Impurities. Alſo, *Fullers* have their cleanſing Earth, with which they well know, how to purifie their ſullied Cloaths. Nor do *Apothecaries* uſe their Herbs for Medicaments, before they have waſhed them in clean Water. So alſo, common Chymiſts ſo long waſh impure Metals, by dulcified Corroſives, till they paſs into ☉ and ☽. But moſt experienced Philoſophers waſh Gold, until it becomes Tincture. Hence is that kind of Soap, which they uſe for waſhing, called the *Soap of the Wiſe*.

But ſome may object, ſaying: I contradict my ſelf; becauſe a little before, I ſaid, Gold and Silver were Homogeneal, and did not at all participate of Heterogeniety. To whom I anſwer. I confeſs, I did ſay ſo, yet I would be underſtood, to ſpeak ſo with reference to thoſe common and known Waters, with which, otherwiſe Chymiſts do generally work upon their Metals, diſſolve them, ſeparate them one from another, and waſh them. Becauſe on Gold and Silver no change falls, but they always remain in one and the ſame Eſſence, according as they are progenited by Nature, therefore, I ſaid ſo. And the Reaſon, why it is thus, is, becauſe *Aqua Regis*, *Aqua Fortis*, Spirit of *Vitriol*, or other Corroſive Waters, are not true Keys, endued with the Virtue of penetrating into the heart of Gold, or of opening the moſt firm Cloſure of the King. For although they do very much corrode Metals, and diſſolve them, yet every Metal remains in its Eſſence, without any Separation of parts. But on the contrary, our *Menſtruum* is a ſweet Key, far more conducible, and better than Corroſive Spirits, and therefore, by Philoſophers is not undeſervedly called, *the Key of Philoſophers*. For there is nothing ſo cloſed, but this can open it. *Our Royal or Capital Key is a Corporeal Spirit, or a Spiritual Body*, which, without any injury to it ſelf, paſſeth not only through Metals, but alſo through the hardeſt Gems, and extracts the fixed Tincture of them, leaving their Bodies white; which exceeded my comprehenſion, the firſt time I beheld it with my Eyes.

Therefore, as this Spirit is endued with Power of extracting Tincture, even from any of the hardeſt *Adamantine* Stones; ſo, it is alſo able to introduce Tinctures into the moſt hard Stones; and that by reaſon of its penetrative Power. Our principal Key is that *Hercules*, which cut off the ſeven Heads of the immenſe *Hydra*. By ſuch an *Herculean* fortitude, *Perſeus*, the Son of beautiful *Danae*, ſuffocated the ſtrong unſatiable Whale or Sea Beaſt, and freed fair *Andromeda*, whom he took to Wife. Whoſoever deſires to know more of theſe, let him peruſe *Ovid*, in whoſe *Metamorphoſis* he may find our Key of Philoſophers accurately deſcribed. Yet his Words can be underſtood only by thoſe, to whom the Art is already known: Otherwiſe, it will be impoſſible, from Fables, to extract the ſufficient knowledge thereof. It is GOD only, that gives light to underſtand abſtruſe things; namely, to thoſe, who fear, love and adore him: More of which, you may find among pious Heathens, than among the Slanderous Malignant, falſe, Chriſtians of this time.

This Fable of *Ovid*, I explained before ſome of my intimate Friends; and beſides, before them ſhewed the Impregnation of *Danae*, *by Jupiters Golden Shower*: Yet they gave no credit to this Demonſtration, becauſe the thing ſeemed ſo vile. Would you hear it? I ſet a narrow-mouthed Glaſs Body, with a flat bottom, upon a Table, and from above through the ſmall mouth, I poured *Danae*, King *Acriſius* his beautiful Daughter, into the Glaſs or Tower; then, by the Counſel and help of *Jove*, I formed a Golden ſhower, which (through the Roof, that is, through the ſmall mouth of the Glaſs) I inſtilled down, into the Boſom of the aforeſaid *Danae*, which ſhe ſpontaneouſly received, and was thereby impregnated, and quickly brought forth her Son *Perſeus*; who afterward, carried upon the winged Horſe *Pegaſus*, ſuddenly helped the fair *Andromeda*, and, freeing her from the Jaws of the Sea Monſter, took her to Wife. Afterward, he ſlew the ſtrong and unconquered *Gorgons*, and got the † Golden Gardens. If any one looks upon this Fable, with the right Eye of his underſtanding, he will find, that *Ovid* hath ſo clearly and perſpicuouſly deſcribed our *Hercules*, or Philoſophers *Key of Keys*; that every one, having knowledge of our Work, in reading this muſt neceſſarily be amazed, to ſee the whole Art ſo evidently detected, and as it were expoſed to ſight. But its being diſcerned and underſtood by ſo few, muſt be aſcribed to the defect of their internal Sight, and the darkneſs of their Sins, in which they have involved themſelves, and are ſtill reſolved to abide in. Therefore GOD, according to his Juſtice, deſervedly permits ſuch Slaves of Avarice and Pride to ſtick in perpetual Blindneſs, to grope for, and in vain ſeek, the way of eſcaping thoſe Evils. For here, the hard is Softned, the ſoft is Hardned, the fixed Volatilized, the Volatile fixed, the Bitter Corroſive dulcified, but the ſweet Converted into a Key, opening all compact Encloſures. More touching ſo great a Myſtery, I ſhall not at this time relate. But, to whomſoever GOD ſhall grant this principal Univerſal Key, he may, according to his Hearts deſire, go whither he will, nothing can be able to reſiſt him: For which ſo great Benefit we owe thanks and Praiſe to the moſt wiſe GOD, for ever, *Amen*.

† *Gold-bearing*.

Alſo *Virgil*, in a few *Heroick Words*, evidently enough deſcribes the way of preparing our Red Oyl of *Vitriol*. Therefore I thought it worth while to inſert his Words alſo, that he, to whom GOD ſhall give the Bleſſing, may the better underſtand the occult meaning of the Poet.

Conſider firſt, what here is to be done.
A Golden Branch, with Leaves of Gold thereon,
Upon a Tree concealed groweth. This
To the infernal Juno *ſacred is*:
But the whole Grove, with diſmal ſhades of Night
Obſcure and keep the ſame from Humane ſight.
And till ſome one ſhall take down from the Tree
This Golden Branch, *there can no Entrance be*
Into Earths Caverns. Beauteous Proſerpine
Ordained hath, that this rare Gift divine
Shall brought be unto her. No ſooner is
The firſt Branch cropt, *but in the place of this*
A ſecond Sprouts, and that moſt pure and fine,
As did the firſt, with Golden leaves *will ſhine.*
Therefore firſt view it well; when rightly known
This Branch *is unto Thee, then with thy own*
Hand crop the ſame: For it will follow Thee,
If Thou by Fates *for this Work choſen be.*
If otherwiſe, no Humane violence,
Nor ſtrength of Iron, force it can from thence.

Virgil here calls *Vitriol*, a concealed, that is, a ſhadowed Tree; adding, that by the help of *Proſerpina*, *Pluto*'s Wife, but one Branch can be cropped by him, whom Fortune ſhall favour; and that it is willing to be plucked off by any Skilful Man deſirous of the ſame. Such a Branch is conſecrated to *Juno*, &c. We know

Juno

Juno, according to Poetical Fictions was the Wife and Sister of *Jupiter*, but *Proserpina* the Daughter of *Jupiter* and *Ceres*, or (as some say) of *Isis*, whom *Pluto* the God of Hell stole away from her Parents and married her. From all which it clearly appeareth, that this Golden Branch sprouting in the green Tree of *Vitriol*, could not be cropped, or obtained without *Proserpina*'s help. Therefore if any one would crop such Golden Boughs from like shadowed Trees, he must learn to know *Proserpina*, and consult with her; becaufe she only can profit him, and prevail with her Husband, to wax the more hot in his infernal Sweating stove, that thence into another place may ascend a Spirit or Oyl of a Blood-Red-Colour.

But this is to be considered accurately, lest this Work, like many other of our Undertakings, be frustrated. Therefore GOD is to be prayed to for his Blessing: For if the Benediction of GOD be not present, all endeavour will be vain; as I have more than once experienced. Although I did demonstrate our helper *Proserpina*, to some of my loving Friends, and taught them how to obtain and rightly use her; yet they were all destitute of so good Fortune, as to elaborate it as it should be elaborated: Yet at length more accurately hitting the Mark, their work succeeded happily twice or thrice, but never afterward.

From which, being so evident, it is plain enough, that such *Arcanum's* are so preserved by the All-seeing Eye of the Divine Providence, as it is never permitted to all Operators promiscuously, that every of them should attain to the highest Science, and thenceforth the Good given be perniciously abused. Wherefore, although one Man communicate any famous Secret to another; yet, if GOD be not favourable, he can never prepare the same, but shall lose his Labour and Charges, spend his time unprofitably, and instead of a Golden Harvest, reap nothing but Trouble and Grief.

Hence they drew their Original, who writ of the Secret ripening Fire. *Our Fire, before Coagulation, always burns in our Glass, but externally not.* It is sufficiently manifest, that Philosophers, by their *Secret Fire*, understood Oyl of *Vitriol*; and that their Fire, is only Fire before Coagulation; after that, no more so, but a sweet Ripening Stone. Therefore they add, that before Coagulation it is Fire, but after Coagulation not so. Aptly with this agrees that Writing of ancient Philosophers. *Visitabis Interiora Terræ, Rectificando Invenies Occultum Lapidem Veram Medicinam.* To which Monument of ancient Philosophers, we may fitly subjoyn this sutable Poesie, making for our present Purpose, and expressing the same in few Words.

Dissolve the Fixt, and make the Fixed fly,
The Flying fix, and then live happily.

In these few Words are compendiously contained, all whatsoever I have largely written in this Treatise.

Moreover, our Salt of Philosophers, besides its being a *Medicine*, and fit for Transmutation of Metals, is also endued with other famous Virtues, of which at this time I cannot forbear to write. Philosophers have written, that their Key of Keys doth indifferently open all closed Bodies, and that it is endued with a Virtue, breaking most hard and Adamantine Stones, and taking from them their inclosed Treasure; for acquiring which, there is nothing at all in the whole Nature of things given, except this our Key, by help of which the most firmly locked Inclosure may be unlocked. As for Example. A *Granate* is a Stone of so great hardness, as although it may easily be reduced to Powder, yet it can never be corroded even by the sharpest *Aqua Fortis*, nor dissolved, nor can it be Anatomized. Wherefore, although these Corrosives, vulgarly known, prevail not against this excellent Stone, (which visibly in it self contains a noble Tincture of Gold, and also is not a little impregnated with invisible Corporeal Gold, as plainly appears by its weight: For it is much more ponderous than all other precious Stones, or the more vile small Stones) but are judged as unprofitable for this kind of Labour; yet our *Sweet Salt* possesseth so potent a Faculty, as it can easily open the same and take from it all its Treasure; in so much, as if there were but this only use of it, (and no other like, better or more excellent were known) it would abundantly satisfie every honest Man, to live amply therewith, and to maintain his Family with great Tranquillity.

Behold I present to you, yet another Royal Experiment, which I have not long since effected, by the help of our Red Stone, in the following manner.

One day I cast our Red Stone upon Gold, in Flux, only for a Tryal, whether by the help of that, the Gold would be tinged with an higher Colour; because I found, that Silver had took a yellow Colour from the same. But after I had poured out the Mixture, I found what was contrary to my Hope. For it was so far from exalting my Gold in Colour, as on the contrary, it took from the same almost all its Colour, so as it was white like Silver. At first, I was not a little troubled, that, contrary to my Expectation, I should work so unhappily. But returning to my self, I begun to think, whether this my Red Stone (being, perhaps made of Steel) was not that *Chalybs*, [or Steel] which *Sandivogius* so highly extolled in his Writings, and said, it could extract from Gold its Tincture. But since, by reason of other Business intervening, I had no leisure to proced further in the Work begun, I was constrained to leave the whole for some higher Experience to another time. Yet I cannot but wonder, that our Key of Keys should so readily unlock every Closure of Gold, and be able to spoil it of its Royal Soul: Whereas otherwise, Gold according to the Sayings of all Philosophers, (as in very deed it is true) and according to the common Opinion of all other Men, experienced in Chymical Labours, is accounted to consist of such Homogeneal parts, as are difficultly separable. If the most wise GOD prolong my Life; and also grant Time and Opportunity of making further Tryal, I will spare no Labour or Cost to find out that *Arcanum*, until by the gracious help of GOD'S assistance, I shall become the Master of that Art of Arts. For now unto me the Gate of the Royal Closet is opened (I would not be envied for what I now say) by our *Herculean* Key in such a manner, as, I doubt not, but in a short time (unless the supream Deity, which I have no cause to fear, notably resist me) to obtain the Kings Crown made of a Carbuncle, and be able to distribute the same among the needy, to relieve their necessity. To which my hope, let the most wise GOD give a Blessing, so, as the Event may answer my Desires, *Amen.*

Moreover, Philosophers say, that whosoever obtains their Stone, can so qualifie Glass, as, if it fall, it shall not break, but be found lying unbroke, like Metal. Which indeed I have often read, but could never believe, it was so to be understood according to the Letter. Yet after GOD, by his Grace, had conferred

ferred on Me our Wonderful Salt, for Curiosity sake, I could not forbear to make an Experiment, to know, whether what was written thereof was consentaneous to Truth. Therefore, I took a little broken Glass, melted it in a Crucible, and then cast upon it only a very little of our Salt, which it continually took in, and thence received a white Colour. I poured out the Mixture, and trying, whether it had passed into another than its first Nature, I found my Glass had received a new Disposition, and became flexible like hardned Steel Wyer, and after flexion came to its first form: But after many bendings, to and again, it at length broke. Whence I learned, that it was no Fable, but plainly possible by Art to prepare Glass so, as it may be no less flexible, like Metal, than it is transparent. But since I have not had Opportunity to make further Tryal, and cannot yet absolutely profess my self an Artist in that kind of Work; yet, I can say, that what others have affirmed thereof, is not estranged from Verity. Therefore I must wait, till Time (with the favour of GOD) give me further Experience thereof.

Also, touching the Stone it self, Philosophers write, that it qualifies its Possessor so, with Lightness and Cheerfulness, that he can, like a Bird, fly up on high from the ground; which is a thing so much repugnant to Nature, as no Credit can be given to it, unless it be interpreted Hieroglyphically, Allegorically, or Enigmatically. But that it greatly exhilarates him, who by the benefit thereof can effect the aforesaid Wonders, is very easie to be believed. For in my self I have found the like Exhilaration, when I have, with these my Eyes, made certain very great Proofs and Experiments by the help of that. When I lay, for four years, continually sick, and during that time, exercised my mind with various Speculations, making some Proofs, I at length found the Truth, and understood that this wonderful Salt, being tryed upon Metals and Stones, did most exactly agree with the Philosophers Description of it: Then, I say, my whole Nature, because of that, was astonished, and daily so notably reduced to a better Constitution, as I can never sufficiently admire the Grace of GOD, and return due Praises to him for so great Gifts. For I, who by reason of my Sickness, could never rise out of Bed before Noon, could afterward rise betimes in the Morning, and go into my Laboratory. Also for a long time before, I could digest neither Flesh nor Fish, but was constrained to live with Bread and Wine only; yet now, (thanks be to GOD) I am able to eat some small Portion of Flesh and Fish, together with other Meats. Likewise for above a whole Year, through weakness of Body, I could scarcely write a Line or two, so as in two Years space I committed nothing to the Press: But now, GOD, the Giver of all good Gift, hath made my hands so ready for Motion, as I sing to him incessant Praises. Without that new refreshing of Strength, this present Treatise could never have been published. And this so great Good befel me from no other Cause, than from GOD, and this precious Stone.

Therefore, whosoever is desirous to partake of this great Blessing of GOD, let him not come to Me, unto whom is given no leave to Communicate; but let him come to the Love of GOD, and draw that laudable Good from him, as from the most limpid and living Fountain: Because, it is to found with him only, not with Men. If a Man humble in Heart, and void of Hypocrisie, hearing this, will follow my Counsel, he may perhaps find a prosperous Event according to his Wish: If otherwise, adverse and contrary. For GOD is not wont graciously to regard the words of the deceitful, but the Hearts of candid Men.

Many other such things might be produced, touching our Tinging Stone: But no necessity persuades to expend time thereabout. Enough is spoken. For whose Eyes soever GOD shall open, he will on every side see so many things sufficient for him, as not to need any further Information. All things are clear to the clear-sighted, which appear dark to the Blind. GOD only is the Light, and all, who are near to GOD, are by him so illuminated, as they can see. But the more remote any Man is from GOD, the nearer will he be to the contrary of Light, which is Darkness. Therefore, whosoever desires to be illuminated with the brightness of Divine Light, must fly from Darkness, which is to be shunned. For Darkness and Light are inconsistent in one and the same Subject; which is a thing accurately to be observed by every Reader.

A COROLLARY.

WE have, in this little Treatise taught, that the Salt of Metals is prepared of *Vitriol*, and that there is a difference to be observed, *Viz.* this,

Common Oyl of *Vitriol* doth indeed suffer it self to be Coagulated into a sweet Salt or Stone, wherewith (particularly) vulgar Metals are amended, and Tinctures extracted from Gems, although it wants a tinging Virtue: But Metals may also be tinged by the Coagulated Red Oyl.

We likewise shewed, that you cannot get this Red Oyl, without the help of that Goddess *Proserpina*. Yet by the way, it is to be noted; that the aforesaid *Proserpina* is no other, than a white Sulphureous Salt, which added to the *Vitriol* causeth the Tincture of *Vitriol* to ascend in Distillation. That, after it shall be duly Coagulated into a Stone not Corrosive, manifests such Effects, as we have ascribed to it. I also thought good to advise, that our Oyl of *Vitriol* in its Preparation requires great Care and Industry, that the Tincture may be made Rich enough: For otherwise, it discovers but little Virtue in Transmutation. Also you shall never get so great a quantity of that Red Oyl, as will satisfie the Common sort of covetous Men: Because that comes not till at last, after all the White is ascended. But he, that can get a large quantity of the White, will not trouble himself to get the Red: Because the White also, by the help of *Proserpina*, may be converted into Red. Which if it were not so, the Saying of *Virgil* could scarcely be found true, *viz.* that with the hand is readily to be cut off, not one Branch only, but many other, if Fortune shall so far favour any Artist. Therefore, I forbear to write more at this time. Let him, who cannot content himself with these here written, search the Monuments of Philosophers, writing, that there is such an Art, by the benefit of which, with one only Pound of Coals, a whole Pound of Oyl of *Vitriol* may be distilled. Yet such an Artifice must not so soon be spread among the People. To whom soever GOD reveals the same, he may prepare it, according to his own desire; if it be otherwise, let him comfort himself with this Meditation of Patience, *viz.* that he was not worthy of so great Gifts. With these, Reader, I bid you Farewel, and commend to you the Protection of GOD.

THE END.

A

Short BOOK

OF

DIALOGUES,

OR,

(Certain) Colloquies of ſome Studious Searchers after the Hermetick Medicine and Univerſal Tincture.

Written for the Sake of the Lovers of Hermetick Philoſophy.

THE

PREFACE

TO THE

Well-minded READER.

I Was formerly minded never to have publiſhed theſe Three Dialogues, but only to have made ſome of my good Friends, and ſuch as had well deſerved at my hands, here and there, partakers of the ſame. And upon this Account I permitted ſome [of them] to Copy them out, but they abuſing that Curteſie [of mine] whereby they received them, did make others of their own Friends too, enjoyers of the ſame, contrary to my Will and Intention; and ſo it happened, that they became Common, and being on this wiſe often Coppied out, there crept in amongſt them (as indeed uſually falls out in ſuch Caſes) abundance of Faults or Errors, and the ſenſe [and true meaning] of my Words were conſtrued in the worſer Part. Which thing when I perceived, that it would more diſadvantage than profit me (eſpecially ſeeing, that ſuch a work [thus Copied amiſs] did neverthelſs paſs under my Name, and was adjudged by others, as really mine) I deemed it, expedient, of two Evils to chuſe the leaſt, and to have regard to mine own good repute, and to publiſh it in mine own Name. But yet, not with an intent of getting my ſelf ſome eminent Fame, as if I were wiſer than others, and to have it thought, that I had more knowledge and experience than many others have; but rather, that the incredible Works of the omnipotent God, and his great Wonders, might be laid open and made known, to the infinite Glory of his Name. In the ſetting down of which, I do produce only ſuch things, as my ſelf have wrought with mine own hands, and can even yet demonſtrate by a certain and undoubted Operation, (by Gods help) at any time.

But yet, I would not have any one thus to underſtand me, as if I had already wholly and compleatly

Part. III. before pag: 23.

in de Dialogus ·

pleatly finiſhed the whole Operation, and had advanced it to a due, and throughly perfect, end, No! I cannot arrogate to my ſelf by any means, any ſuch matter. Thus much I only affirm, that if any one ſhall (in his Operation) follow the bare literal Deſcription of theſe Labours, he will without any Error arrive, ſo far as I my ſelf am already come, but yet with this Proviſo, that he knows the true Salt of the Philoſophers, and the uſe thereof; And as for what remains, [unfiniſht] I commit unto God to beſtow a proſperous Succeſs: And this one thing I entreat, that every Body accept of the things I have here written, with the ſame mind I wrote them, and that he take in good part my ſincere Endeavours of deſerving well at his hands.

The Explication of the annexed Figure belonging to this Treatiſe, noted with theſe Words: *Inde Dialogus.*

IN the four principal Points of the Circle (ſuppoſing two tranſverſe lines were drawn, through the Center, to the outward Circumference) are placed the Characters of Sol, Sulphur, Lune, Salt.

Round the outmoſt Circle, are placed theſe Words: Conjoyn in one, Sol, Salt, Sulphur, Lune.

About the next Circle: And thou haſt as great a Treaſure, as Heaven can give thee.

Within the Third Circle: The Philoſophers Function, is of Contraries, the Conjunction.

About the next Circle: The Concentration of Homogeneals, is the Separation of Heterogeneals.

Within the inmoſt Circle: Sol, Salt, Sulphur, Lune.

The Firſt Dialogue, or Conference, betwixt two Lovers of Hermetick Medicine, deciphered by the Letters, A. and B. the laſt of which hath had a proſperous Succeſs on his Labours, the other not; and therefore craves of this laſt (viz. B.) a Manuduction to the Work, whereby he is rendred Maſter of his deſire.

B. A Good health to you, my Friend! What's the matter with you now, that you are ſo ſad, and even loaden with Cogitations, and mumble to your ſelf about I know not what?

A. *Oh, my Friend! I wiſh you the like very heartily; and am glad that you come ſo very ſeaſonably, and at ſuch a time, as I was juſt thinking on you, and moſt earneſtly wiſhing your approach; Witneſs your own Writings, which I do here turn over with my hands and my mind, but yet they are ſo very obſcure, that I cannot worm my ſelf [as I may ſay] out of them, [or underſtand them] though I apply the utmoſt of my Endeavours to underſtand them. I have likewiſe read over and over again, the Writings of other eminent and belief-deſerving Philoſophers; ſtill hoping, that I ſhould yet at length attain to the knowledge of the Truth: But alas, (the more's my grief) all that I find is only this,* viz. *that I hold in my hands the ſlippery Tail of a ſlippery ſmooth Serpent, [or Ele] which ever now and then ſlips out of my hands, and doth more and more defile me. I have therefore reſolutely determined with my ſelf, that, unleſs God doth ſhortly ſend me ſome good Friend, who may lead poor me out of ſuch a notable Labyrinth, I will throw all my Books, all my Inſtruments, and all ſuch matters which I have beſtowed ſo much time about, in vain, and loſt ſo much by, into the Fire, and Sacrifice them unto* Vulcan, *that ſo I may be rid of the tedioufneſs of my fruitleſs Labours, and unprofitable Cookery. But yet if you would be but ſo pleaſed, I no ways doubt, but that you might by a few words [and Directions] reduce me out of the ſnares of ſo many Erroneous paths, and hedged up ways, into the right path: For I well know, that you have beſtowed your whole Age, your whole Study, and all your Labours and Endeavours, about ſuch great Secrets, and have by the Divine aſſiſtence obtained the very Truth it ſelf. And therefore I do moſt humbly beg at your hands, that you would not leave me deſtitute of your help, but that, according to your inbred Goodneſs and Courteſie, you would ſuccour me, your Friend, with ſome brotherly inſtruction, and Manuduction. Which if you either will not or cannot do, I muſt even conclude, not only upon throughly doubting of the Truth and poſſibility of this Art, but withal, on a firm perſuading my ſelf, that thoſe Writings, which*

which are ſo ſtuft with the Promiſes of golden Mountains, are nothing elſe but mere Old Wives Tales, and frothy Speculations of idle Men, and vain Dreams, though proceeding from Men of ſo great Eſteem.

B. Whats this, I hear thee utter? I could never have believed you, to have been of ſuch a broken and dejected mind. What? Would you contemn the Writings of the Philoſophers, and ſlight them, becauſe they are above your Capacity, and too hard for your underſtanding? Tis a wicked thing, to entertain ſuch a thought, much more to utter it. I would have you, rather to perſuade your ſelf, that you are not as yet worthy of the Secrets and Gifts of ſo great worth: For though a Man ſhould torment himſelf with abundance of hard Labours in this World, and ſhould afflict his Body with unceſſant Sweating pains, yet would he not effect ought without the Bleſſing of God. Do you not know that ſaying of *Paul*; *Tis not of him that Wills, nor of him that Runs, but of God alone that ſhews mercy.* You ſhould therefore reckon your ſelf amongſt the number of thoſe, that have run in vain, nor hath God injured you at all. What! does not Chriſt ſay, *Not all that ſay unto me, Lord, Lord, ſhall enter into the Kingdom of heaven, but they only who do the Will of my Father.* Examine now your ſelf, and ſee how the Caſe ſtands 'twixt God and you. The beſtowing of ſuch great things muſt proceed from God, and not from the Philoſophers. The Philoſopher may indeed write down the Truth, but yet it is not in his Power, to beſtow upon thee the Divine Bleſſing, which is the very hinge on which all good things depend. Secrets of ſuch great moment are not the Gifts of Men, but of God, who beſtows them on whomſoever he pleaſeth.

A. *In good time! Is this the Comfort and Inſtruction, which I begged at your hands? I did not requeſt, you to be my Father Confeſſor, to hear my Confeſſion of my Deeds, but rather that you would help me, being ignorant and unskilful, by ſome good and profitable Manuduction and Inſtruction: For I well enough knew, that wicked Men are never Maſters of ſuch great Secrets, nor will I rank my ſelf amongſt them. Be pleaſed but to regard my ſuit, and only ſhew me an entrance, whereby I may enter into the right and Kingly way: And as for praying to God, and Labouring without ceaſing, leave the Care of that to me: I hope, that God will not deny his Bleſſing upon my Prayers and Labours.*

B. Well! ſince I perceive you to be ſo throughly bent, with your utmoſt ſtudy and unwearied preſſing on, after ſuch an eminent thing as this is, I cannot but ſhew you that way, which I my ſelf have walked in, and that too, home to the very place which my ſelf am come unto. Verily, I ſee the promiſed Land afore my Eyes, and do daily view its Coaſts, nor do I doubt, but that I ſhall ſhortly enter thereinto, and have the Fruition of its moſt pleaſant Fruits, if no impediment debar me of ſo great an happineſs. And as concerning your ſelf, ſeeing that you are nimbler of your Feet than I am, there's no doubt but that you will arrive thereunto, even aſſoon as I my ſelf. But yet, pray firſt declare unto me, about what things it is, that you have ſpent your Monies, your Labours, and your Precious time and all to no purpoſe; that ſo I may (as much as in me lies) the more conveniently reclaim you from your Wandrings and Errors into the right way. Tis in vain for him that is ſick, to expect help and ſuccour from the Phyſician, if he does not ſhew the place of his Dolour and Grief. Confeſſion is a Medicine to him that goes aſtray. Confeſs therefore the Truth, that I may hear, by what things thou haſt been miſ-led into ſo many Errors.

A. [*Alas, Sir,*] *I could not reckon up all, in Order, though I ſhould have time enough of ſo doing. But your own time, which is far more precious, does not permit, that it ſhould be ſpent in hearing my fooliſh Labours. Beſides too, the remembrance of ſo many Labours in vain, and of the loſs of not only ſo much Time but Expences too, cauſeth a loathing in me, the very remembrance of which I abhor, much more to make a long rehearſal of the ſame. You may therefore eaſily gueſs, that by my inſiſting upon the bare Letter only of the Philoſophers writings, and not underſtanding the ſenſe and meaning, I have erred from the right way, and have headlong hurried my ſelf into ſo many Intricacies and Errors. I have ſearched into Vegetables, Animals, and Minerals, becauſe the Philoſophers write, that their Stone is Vegetable, Animal, and Mineral; but I ſee, that I have not had under my hands the true Matter. For if there does appear in any* [*of theſe Matters*] *the Crows head, yet the other Colours which the Philoſophers make a deſcription of* (*as the Dragons Blood, the Peacocks Tail, Virgins Milk,* Coagulum, *or Curdling, and principally that Red and Fire-abiding* Salamander) *did never appear* [*to my view.*] *Or, if theſe* [*Signs*] *of* Sanguis Draconis, *or* Lac virginis *appear to ſight, in ſome other Matter, yet notwithſtanding the other Colours, and other Signs, which the Philoſophers make mention of, did never diſcover themſelves* [*to my view.*] *What Labours ſoever I have uſed, and whatſoever matters I have dealt in, I have even Laboured in vain, and loſt both my pains and Expence, and never have received any good from my laborious Operations. Hereupon I did at laſt even almoſt throughly perſuade my ſelf, that it was an impoſſible thing, that, out of one Matter, and by one and the ſame Labour, one Colour ſhould orderly ſucceed another, and become viſible to the ſight, by the bare help of an external Fire, as for example, firſt of all, in the putrefaction, the Crows head; then the Peacocks Tail, then the Dragons Blood,* Lac virginis, Coagulum *or Cheeſlike Curdling, and at laſt the fixt* Salamander. *But foraſmuch as it appears to me, by the reading of your Writings, that you have orderly met with the ſight of all thoſe Colours in your Labours, in ſuch manner as the Philoſophers have deſcribed the ſame, I do firmly believe, and give Credit unto your Sayings, as unto a Man that makes Conſcience of his ways, ſuppoſing, that you would not write ſuch things unleſs you had wrought them with your own hands, and could even yet perform them at any time. I only beg your help in ſhewing me the true matter, and the Key thereof, that I may ſo order the Buſineſs, as to cauſe the Viſibly appearing of one Colour after another, in one Glaſs, and by the bare help of one only Fire; if you do but thus much for me, you may be confident that I ſhall be the moſt contented Man* [*alive.*] *Nor do I doubt, but that as touching the remainder, as Multiplication, Projection, and ſuch like, I ſhall find out thoſe Operations well enough afterwards, by mine own ſtudious Search, if I can but once hit on the entrance of the right, true and Kingly way.*

B. [Hold a little, and] do not aſſume ſo much unto your ſelf, and think that the things which are ſo eaſily ſaid, are with as much Facility done. Have you not Read in *Bernhard Treviſan*, that a certain [Friend of his] had that great Secret as well as himſelf, only he knew not how to multiply it, nor would *Bernhard* reveal the ſame unto him, as having the ſelf ſame Books, out of which the ſaid *Bernhard* got the knowledge of Multiplication, himſelf. But be it as you deſire, and ſeeing you requeſt no more from my hands at this time, but only the matter and ſome Key; I will ſatisfie your requeſt, as far forth, as the time and occaſion will at preſent permit.

Attend

Attend therefore with diligence to those things which I shall say unto you and such things they shall be too, as unto which you may boldly give Credence. I will not (according to the Custom of many) seduce you, nor will I reveal unto you ought else, but what I have experienced by the Labours of mine own hands: And if you follow the guidance of the bare Letter it self, you will not err, unless God will not permit you to proceed, [but] throw some peculiar impediment and lett in your way.

As touching the matter, which the Philosophers have made that Universal Medicament of, I find that it is not merely *One*, but *Divers*, and this is clearly evident from the Writings of the Philosophers, who openly hint unto us, that one of them used this way and matter; another, that, and yet at length became Masters of their desire notwithstanding. From whence it necessarily follows, that the different matters, of which is made one and the same thing, are not unlike in their more inward parts, but alike, though they do not appear so to be, as to their external hue. For it is a thing possible for two, three, or more things to differ much, [from each other] as to the outward form and shape, whereas notwithstanding in their inward parts, they are so agreeable to each other, as that the self same thing may be produced from the one as from the other. Take, for an example of this thing, the *Seeds* and *Roots* of some Herb, the which, as to the outside form, have no likeness to each other, and yet for all that, do they produce one and the same Herb, if they are implanted apart in the Earth. Just thus is it with the Metallick Buds and Stocks which are wont to sprout forth, as well from the Metallick *Roots*, as from the Metallick *Seeds*, in so much, that a Tree grows up of the same Nature and Form from the Metallick *Root*, as Springs from the very *Seed* it self. Now 'tis evident, that in the Metallick Kingdom, ♄ or Lead supplies the place of the *Root*; ♂ or Iron, of the Trunck or Stock: *Jupiter* or Tin, of the Bark, ☿ or *argent vive*, of the juice betwixt the Trunck and the Bark; ♀ or Copper, of the green Leaves; *Lune* or Silver, of the white Flowers; and ☉ or Gold of the ripe Fruit and Seeds. If therefore the Metallick plant is to be multiplyed, that Multiplication cannot be more commodiously effected then by ☉ and ♄, that is, by the Seed, or by the Root of the said Tree. Whosoever therefore desires to perform ought in this kind, he will not find any convenienter matters, then ☉ or ♄, that is, Gold or Lead. But yet I do not mean those vulgar Metals, but such, in which the Gold lyes as yet immature and invisible, and which is to be made visible, fixt, mature and constant by the help of Art. So then, the self same thing which may be discerned, above, in *Sol*, and appears visible to the sight, is in like manner found beneath in *Saturn*, in an invisible manner. And thus experience it self shews, that, out of two things unlike, as to the outward shape, one and the same thing like them may be made, because their internal parts are of one and the same Nature, and this outside difference or unlikeness proceeds only from the impurity, and defect of Maturation. Out of *Saturn* therefore, as out of an unripe and impure Gold, some good may be produced: But it must of necessity be well washt, and out of it being well washed, may the first *Ens* of Gold be extracted, and be fixed. But now, if out of mature Gold, you would yet educe something, it must then again first putrefie and be reduced into nothing, afore any more noble thing can proceed there out of. For it is like to the Seed of the Vegetables, which do's not admit of any Multiplication of it self, unless they are first put in the Earth and consumed by Putrefaction: And this is proved, and asserted by the Testimony of our Lord Christ himself, who says, that except a grain of Wheat rot in the Earth, it cannot bring forth any Fruit. Certain it is therefore, and firmly true, that Gold cannot be translated into a better degree, unless it be again destroyed, and reduced into such a Body, as out of which it cannot be reduced into its former Golden Body [or Form.]

A. *What is it that you say, can it ever be possible, that a Metal so constant in the fire should be on such wise destroyed, as not to be reducible unto its former Body? Verily I have but small reason to boast of any great matters done by me: For I have for some years past tormented my self hitherto, about decocting and cooking of Gold: I have dissolved it in sundry sharp [and Corrosive] Waters, and have beheld its ascending with its yellow Colour, by a Retort and through an Alembick, but yet I never got ought else in the Precipitation of the same, but common Gold, and which was not in the least bettered thereby. And therefore I did at last conclude with my self, as many others have done, that the common Gold could not be the matter of the Philosophick Stone, and it holds hidden within its Body, no more Tincture than it stands in need of, it self; and that therefore it has not the Faculty of tinging other white Metallick Bodies.*

B. I do not at all wonder at your falling into this Opinion. There are many others besides you, that are of the same mind; Nay, I my self doubted much about this very thing, *viz.* whether or no, Gold hides within its *inward* parts any more of *Colour*, than it shews unto us in its outside shape. But then on the other hand, it could not seem at all likely, that such eminent Men should publish such great Fallacies and so many Lyes, merely to seduce Men, by. And whilst I was thus wavering in this kind of doubting, the Truth did at last (after sundry and many inquisitions) by a mere chance present it self unto me; in so much, that I am now clearly convinced of my Error, and am even constrained to believe, that a true Tincture, tinging the imperfect Metals, may be extracted out of Gold. For well may that be believed, which the Eyes see, and the hands feel.

A. *I rejoyce exceedingly to hear you say, that you have seen the Truth, and I hope that in time you will refresh me with a sight thereof too.*

B. Whatsoever lyes in my Power to serve you by, I will not in any Case deny unto you: But thus much I would you should know, that the Splendor or brightness of the Truth it self hath shone upon me, but I have never as yet brought the work it self unto an end, by reason of the want of time: But yet however, I am confident and firmly persuaded, that if no impediment chance to happen, I shall bring it to its wished end. And now seeing you are by some years younger than my self, and that you have store of time and all other Conveniencies, I dare be confident, that you would finish that Operation much sooner, should I but reveal unto you those things, which I am already arrived to the knowledge of, by the Labours of mine own hands.

A. *Proceed on, I pray, in this your Liberality, and make me, as being a Man following after Honesty, partaker of your Happiness, and I shall be everlastingly obliged to you and yours. And whatsoever Labour or Task is to be undergone for you; I will with a ready and willing mind undertake it, and in all things respectfully regard your wholsome Instructions.*

B. Well! I trust you, and believe, that you will perform your Promises, by which you bind your Credit;

but however you ſhall give me your hand, and Promiſe me, that you will conceal the Art in moſt profound ſilence.

A. *I will, here's my right hand, and Credit upon it.*

B. Hearken then, with your utmoſt diligence, and with an accurate intention, receive the things which I ſhall ſpeak unto you.

A. *I do, and I liſten attentively.*

B. In the firſt place then, you are to know, that, if you would make any good thing out of the common Gold, you muſt perfectly caſt out of your mind that Opinion, which hath hurried not a few into no ſmall difficulties, imagining, that (by the help of ſome *Menſtruum* or other) the *Colour* of the Gold is to be extracted out of it, and that Silver is to be tinged, with that ſame Golden Tincture thus extracted, and that, to the remaining white Gold, its Colour may be again reſtored by the other leſſer Metals, as ☿ or *Antimony*, Copper, or Iron: Such thoughts as theſe you muſt clearly remove out of your mind, as being thoſe which rob a many of their precious Time and Eſtates. There are ſeveral ways, by which I know how to extract the Colour from Gold, but tis needleſs to reckon them up here by a tedious repeating of them, ſeeing they are not any ways profitable, but rather cauſe loſs of Time and Goods. The main thing you are to mind is this, *viz.* to meditate [and enquire] by an accurate and unceſſant ſtudious Search, by what means you may deſtroy Gold, kill it, and ſo compel it by Putrefaction to produce to view its internal and inviſible Colour, and (on the contrary) to introvert (and hide) its external and viſible Yellowneſs. For Gold it ſelf is no other thing ſave a mere Tincture, to the acquiring of which, there needs not any other thing ſave the true Key, which unlocks Gold, introverts it, and renders the inviſible Colour, viſible. Beſides, neither are thoſe to be hearkned unto, who boaſt of reducing Gold into its three Principles, *viz.* *Salt*, *Sulphur*, and *Mercury*; and of freeing thoſe three from all their impurities, and then, of conjoyning them again, being thus Purged, and of Fixing them into an Univerſal Tincture; and ſuch like moſt impertinent trifling Proceſſes, as theſe. For they are mere idle Dreams, and can never be accompliſhed, but come to juſt nothing, and clearly delude the Covetous Thirſters after Gain, by their vain dependence thereupon. Nor are there in Gold any of thoſe Feces, which they prate of its being defiled with, neither doth it admit of being ſevered and diſſolved into thoſe three Principles. But put Caſe it were poſſible ſo to be, what profit, I pray, could we hope ſhould accrue to the ſaid Gold by ſuch a fruitleſs Labour, whereas we ſee, that it is not in the leaſt meaſure bettered by ſuch a Separation. It remains therefore for an undoubted Truth, that Gold neither contains any Feces, nor admits it of a reſolution into Three Principles, but that it rather requires to be Radically diſſolved by a due Putrefaction, and to be ſo opened or unlockt. And farther, the Labour of ſuch Men is likewiſe vain, who Endeavour by the help of Saline, Cementations to extract from Gold, its Soul: For though ſuch Cementations may ſometimes ſucceed ſo well, as that the Gold when taken out is plainly white, yet nevertheleſs ſuch a white Gold doth as yet contain in it its own peculiar Colour, the which, a little *Saltpeter* caſt in upon it in Flux, doth eaſily reſtore unto it: For then that whiteneſs vaniſheth, and the Truth appears, and ſhews you, that it neither loſt its yellow Colour, nor its weight, but retained them both, in the Cementation. Nay, we have been many times deceived our ſelves by theſe kind of Operations, and have perſuaded our ſelves, that we had diſpoiled the Gold of his Colour or Tincture by the Salts, whereas it had but only attracted a certain *Sulphur* out of the Salts, by which it was made White. You may give Credit unto me, for I ſpeak experimentally, and do not tell you dreaming Stories. I will inſtance it unto you, by an Example. Diſſolve a little Gold in ſome *Aqua Regis*, and pour the Solution upon powdered *Tartar*, that ſo being poured upon the ſaid *Tartar*-powder, it may be hid and covered over: Put this *Tartar* thus moiſtened with the Solution of the Gold, in a ſtrong Crucible, the which you muſt cover well with a Cover, and lute it: Or rather, put it in a Cementary Pot or Veſſel, which will be better. The Veſſel being placed in the Cementary Fire, the Gold will extract a peculiar *Sulphur*, and become White and Brittle, after its Separation from the *Salts*, by being melted. And now who is it, but would believe, that the Salts had extracted the Colour of the Gold from it, whereas it is no ſuch matter. For a little *Saltpeter*, or elſe the *Cineritium*, or *Cupel* can drive away all this white Colour, and reſtore it to its former Yellowneſs again; and this is, what my ſelf have ſeveral times done and experienced with mine own hands.

A. *Now again, here's a new Story I never heard of afore, who would ever have believed, but, that when they had taken their Gold (tinged with a whiter Colour than Silver) out of the Cementary Veſſel, it had been clearly diſpoiled of its Tincture? But now ſeeing it is not ſo, there muſt of neceſſity lye hidden under ſuch an Action as this, ſome other Secret and Wonder. Verily it is no trifling Matter thus to make Gold white, without the help of the white Metals; and it is the more wonderful too, becauſe it is not known, from whence that white Colour receiveth its Riſe: It could not get it from the* Aqua Regis, *nor could it have it from the* Tartar, *and this makes me ſtill wonder the more. And therefore, pray, rid me of this doubt, and unriddle the buſineſs unto me, for 'tis not without cauſe, that I ſuppoſe ſome great Secret may lye thereunder hidden.*

B. Attend diligently to what I ſay, therefore, for its impoſſible for you to apprehend all things at one very daſh [as I may ſay, and at firſt.] We will firſt of all treat about the Gold only, and of other Secrets afterwards in due time. But yet [by the by] I would have you obſerve in this place, this one thing; that as touching that *Sulphur*, which made the Gold white and brittle, there muſt needs be a notable Friendlineſs betwixt them, becauſe it was ſo eaſily extracted out of the *Tartar* by the Gold. And upon this Account there may be ground to ſuppoſe, that if the Gold were left lying longer in that cloſe Cementation, that *Sulphur* which rendered the Gold ſo white, might haply be rendred Red, and fix in the Gold. For every *Sulphur* is a Tincture, when it is made fixed, and gets an Ingreſs, from the other Metals. Do not undervalue this Secret, but fiſh out the Property of this thing, by a more accurate Meditation, for you will draw from thence much Good.

A. *Verily, I can methinks conjecture, that this very knack hath more in it than it ſhews for; I will ſearch thereinto more accurately; perhaps this very way is a nearer one, than that which requires the inverſion of the Gold. I remember that I have read amongſt the Sayings of the Philoſophers, this Expreſſion;* That their Gold does not tinge, unleſs it be firſt tinged, nor receiveth it a Red Colour, unleſs it be made firſt White. *I perceive, that Nature is more abundantly ſtored with infinite Riches, and that it cannot be ſo eaſily Searcht out*

to

to the bottom, and the longer a Man seeks, the more he finds and meets with; insomuch that at last, there is such plenty of good things offering themselves to such Seekers, that it makes them puzzeld which to choose, seeing they so commend each others Benefit and Profit. Besides, your words are very hard to be understood, and hard to be born. For it seems a thing exceeding all belief, that the most constant Fire-during-Metal, Gold, should be so changed, as to be no more Gold, and very hardly, yea, not at all reducible by the help of Art into its former Body. I do often meet with that Opinion and Decree of the Philosophers in my frequent reading of their Books, viz. *that Gold must be putrefied, if any better and nobler thing is to be generated thereout of: But whereas it seemed unto me a thing beyond the Power of Nature, and altogether impossible, for such a constant Matter to undergo any Putrefaction, I supposed that the Philosophers pointed at some other thing by that Putrefaction of theirs. Mean while, I earnestly expect from you a Demonstration of the possibility and Truth of this thing.*

B. Come then, on God's Name, a little nearer me, and heed well the things which shall be shewn unto you.

We will here take half an Ounce of common Gold, and put it into this *Aqua Fortis*, made of *Vitriol* and *Saltpeter*, whereto we will add the same weight as the Gold is of, or a little more, of our *Saltarmoniack*, without which, the *Aqua Fortis* alone, and by it self, is not able to dissolve the Gold.

A. *Pray, Sir, why do you say, Our* Salarmoniack? *Are there several and different kinds of it? For my part, when I dissolve God, I put into the* Aqua Fortis, *that* [*common*] Salarmoniack, *which is every where to be had in the Merchants Warehouses, and is very fit to dissolve Gold into a Yellow water.*

B. You speak very well after your own way; And I confess, that every *Salarmoniack* mixt with *Aqua Fortis* is very good to dissolve Gold; nor is this any new way, for 'tis in very much use amongst all the *Chymists*, who are wont on this wise to dissolve their Gold, but yet that which is thus dissolved, still remains Gold, and doth easily admit of being again precipitated out of the *Aqua Fortis*, and of being reduced by Fusion into the former Body, it had afore its Solution. But if so be, that the Solution shall be made by the help of our *Sal Armoniack*, then is the Case vastly altered, and your attempting its Reduction again will be in vain. For if Gold be but dissolved barely once with our *Saltarmoniack*, it admits not any more of melting, nor doth it of it self return again into a malleable Metallick Body, but gets a Reddish Scarlet kind of Colour in the Tryal [or Crucible] and remains an unfusil Powder. And if you add some *Borax* thereunto, and set it in the Fire then to melt, it will pass into a Red Glass, which is a sign of its being plainly destroyed, and of its being transmuted into another Body. And therefore I dare aver, that there is seated in our *Salt Armoniack* a power of inverting, and transmuting Gold, and of making it fit for the Philosophical putrefaction; which thing is impossible to be done by any other Salts whatever they be, and what Name soever called by.

A. *Certainly, this is a Divine miraculous thing, to subject Gold, so mightily constant in the Fire, unto Putrefaction, and to reduce it by Putrefaction, into a nothing: For I have read too and again, amongst the Philosophers Writings, that it is an easier thing to make Gold by Art, than to destroy Gold made by Nature. And therefore this Salt must needs be a very wonderful one, which is able to effect these and other, the like almost incredible things.*

B. Well may you term it a wonderful Salt, for so it is, the like of which, no Man will find in the whole World; though to such as know it, it is so vile and mean a thing; insomuch that scarce any one would think it likely, that such things could be done thereby, as are wont to be, should it be but named by its own proper Title. Does not, I pray, that Philosopher, *Cosmopolita* [or *Sandivow*] confess, that he hath oftentimes declared the Art, and Secret of the whole Philosophick work, word for word, sometimes to one, sometimes to another, and yet they would not at all believe him, by reason of the meanness, or vileness of the Work? And does not he make frequent mention of his own, and not the common *Sal Armoniack*? But that you may yet give more belief and credit to our Salt, I would have you read the *Turba* of the Philosophers, wherein you will find all those things which they have published concerning their Salt: And amongst others, hearken to those few words, which the Rosary mentions: *Our Salt dissolves Gold into a red Colour, and Silver into a white Colour, and transmutes them out of their Corporeity into a Spirituality, and with our Salt, are their Bodies calcined.* And for this reason, *Lumen Luminum*, also says, *That if the Omnipotent God had not created this Salt, the Elixir could not have been perfected, and the Study of Chymistry would have been in vain. Avicen* saith, *If thou hast a desire of getting Riches, prepare Salts, that they may be changed into a clear Water, for by the Fire are Salts changed into Spirits: Salts are the Roots of thy work. Hermes* saith: *All Salts are Enemies to our Work, and to our Art, save the Salt of our* Lune: *Arnoldus* saith, *Every Salt that is well and rightly prepared, is of the Nature of* Salt Armoniack, *and the whole Mystery of our Art consists in the Preparation of common Salt: He therefore that knows Salt, and its Solution, to him is the Mystery of the ancient wise Men known. And therefore bend the utmost Meditations of thy Wit upon the Nature of that Salt only, in which the Wisdom of the ancient wise Men, and every Mystery, is found hidden and concealed.* The Writings of the Philosophers are full of those and such like Sayings, and they do every where mightily insist upon Salt. And now, what think you of these Testimonies; what! do the things I have spoken, yet find any belief in your Breast?

A. *Yes Verily, and now I am on your side; but yet I do as yet desire, and heartily wish for this one thing, that you would for once let me see your Labour, whereby I may convince other incredulous Persons, and make them believe too.*

B. Well, I am content; and come let us go to work, and let us put the Gold in its requisite *Menstruum*, and place it in warm Sand, thereby to hasten forward the Solution of the same; though there is strength sufficient in our *Menstruum*, to dissolve the Gold in the Cold without Fire. We shall in a short time see it of a yellow Colour: And behold that very Colour, and the Gold it self is so changed, as it is never more reducible into its former golden Body. Thus have you now the entrance and beginning, which as yet is vastly distant from the wisht for end: And when you now see the beginning, know, that is the first day of our Philosophick Labour. Next, let us proceed to the Putrefaction of the dissolved Gold, without which, no Colours present themselves to our view. Behold in this very moment, *Sol* begins to wax black, and in a little while after it will conceive such a thorough blackness, that it will be like to Ink, and may serve to write withal on Paper. This blackness, the Philosophers call the Head of the Crow, by that

that Name pointing out unto us their Putrefaction; by which, the ſecond day of our Philoſophical Labour is finiſhed.

Our Ground [or Earth] therefore, being ſufficiently enough moiſtned, we muſt beſeech God to beſtow upon us the hot ſhine of the Sun; for without the Suns heat which ſtirs up the Life in all things, there cannot poſſibly be any increaſe and growth. Lend me therefore your beſt attention. Aſſoon as the putrefied Body of our *Sol* ſhall feel the warming heat of the Sun, its blackneſs, which was the true Sign of its Putrefaction, will vaniſh away by little and little, and give place to the acceſs and approach of many moſt delicate Colours, the which, the Philoſophers have named the Peacocks Tail, and this finiſheth the third day of our Philoſophical Labour. And now, when the Fruit-producing Sun ſhall have thus illuſtrated our Field, or Ground with its warmer Rays, but for one day as yet, we may eaſily ſee, what is farther likely to come to paſs hereafter.

A. *Huy da! what a wonderful thing is this, that I ſee here? in how ſhort a time, and how ſpeedily hath the Peacocks Tail changed it ſelf into a thick Blood? Who could ever believe it, unleſs he had ſeen and beheld it with his own Eyes?*

B. I confeſs it is ſuch a thing as may well cauſe in any one moſt exceeding admiration, ſeeing that there proceed from Art and Nature, Operations of ſuch great moments: God hath made all things very well, and ſhould he not permit ſuch an admirable changing of Colour, to appear in the Operation, verily the Philoſopher would be in doubt, whether or no he might hope for an happy Succeſs of all his Labour: And now upon the occaſion of this Blood-like Colour, is ariſen the Name of Dragons Blood amongſt the Philoſophers, who ſay, that when this Colour appears in view, the fourth day of the Philoſophical work or Labour is finiſhed.

A. *Good God! how great, and how wonderful are thy wonderous Works, who can find them out by his own Search and Induſtry? There do daily happen greater and greater encreaſings of our Faith, ſeeing that I behold with mine own Eyes, ſuch things as heretofore exceeded all my belief. And I entreat you to tell me this one thing, whether or no, there lies in this Blood, as 'tis now prepared, a moſt excellent Power of healing Diſeaſes or no, and if it may ſafely be made uſe of, for the healing of Sickneſſes without any farther Preparation?*

B. Yes verily, there does lye therein hidden, an incredible healing Faculty, and this, its very Signature doth openly witneſs. For God doth not ſign or mark all the Herbs, all Animals, all Stones in vain, by the external Signature of all which, it is an eaſie matter to know, what uſe they are of for Mankind. Foraſmuch therefore, as our Gold is turned into a thick Blood, it is a moſt certain Teſtimony, that it is Serviceable for the curing and amending of Man's Blood. For, if the moſt ancient Phyſicians have made uſe of Gold, reduced either by filing into a moſt ſubtile Powder, or by beating into moſt thin Leaves, in the Cure of the moſt deſperate Diſeaſes, yea, and of the Leproſie it ſelf too, and this not without Fruit, and Succeſs; how much greater commerce then will this Gold of ours thus changed into a Red Blood, have with the Blood of Mankind. Would it not [think you] abound with a greater Power of freeing it from all falſe and ſuperfluous Aqueity, and other evil Humours and Impurities, and of reducing it into its former State of Good health? For the occult Virtues of the Gold are no more ſhut up now, like as when the Corporal filed, or leafe Gold held them lock'd up, that they are unlooſed, and releaſed from their Fetters, and ſo perform their work by moſt free and unclogg'd Operations. And ſeeing that Gold is, by Ancient and Modern Phyſicians, attributed to the Heart, and to the whole Blood of Man's Body, and ſeeing that experience it ſelf hath demonſtrated, that it takes away the preter-natural affects of the Heart, and heals the corrupted Blood; why ſhould not this our Blood of Gold effect the ſame with greater Efficacy, and a more happy Succeſs. With this very Blood, have I already performed wonderful things in the moſt grievous Diſeaſes in the Bodies of Men, after they have been firſt purged with ſome *Panacea*. I have therewithal healed the Leaprous in a ſhort ſpace of time, and ſuch as have to no purpoſe made uſe of the aſſiſtence of the moſt eminent Phyſicians for ten or twelve years continually, to their great Coſts and Charges, and this I can evidence by moſt clear Teſtimonies, which I keep by me. Nay farther, even at this very day in very many places, into which I have ſent of this Blood, the deteſtable Leproſie, the *French Pox*, and other moſt grievous Diſeaſes of the Heart and Blood (to the Cure whereof, Gold is in an eſpecial manner ordained by God) are taken away by an admirable way of healing: For ſeeing, that (as we ſaid afore) it ſtrengthens the Heart, and mundifies the defilement of corrupt and polluted Blood, and purgeth them away, it muſt of neceſſity likewiſe expel, as well the open or viſible, as the occult and hidden Diſeaſes of the Body of Man. For if Nature be but corroborated, it doth eaſily ſubdue and expel Diſeaſes, by the help of other very ſmall Medicaments; the which thing I have by my manifold experiences found to be moſt true, when I have adjoyned this Aureous Blood to other ſutable Medicaments. For it cannot be expreſt, what, and how much I have done, both in young and old, with this very Blood ſo exhibited, in the *Stone*, *Gout*, *Dropſie*, *Leproſie*, *Epilepſie*, and other Chronical Diſeaſes, which have taken deep Rooting in the Body. Therefore if God ſhall pleaſe to lengthen out my days, I will very ſuddenly publiſh the uſe thereof, that ſo it may be brought into common Uſe in all Diſeaſes. For this Golden Blood may [probably] be the potable Gold of the Ancients, which never more ſuffers it ſelf to be reduced into its former malleable Body. I have ſundry ways attempted to reduce it, but never could effect the ſame. But yet this one Caſe I except, *viz.* a little of this dry Blood, being put upon molten Gold, hath ingreſs into the ſame, and the reſidue ſwims at the top thereof like an Earth: but yet that little which adjoyned it ſelf to the Gold, is of ſo great a Power as to make all that whole Body of Gold which it entred into, brittle, yea ſo brittle, as that it ſuffers it ſelf to be beaten in a Morter into moſt fine Powder.

A. *I Marry, Sir! theſe are Miracles indeed, which I ſee and hear; who will make any farther doubt, but that the Univerſal Tincture which heals the Sickneſſes, or Diſtempers both of Men and Metals, may be prepared, out of this Golden Blood? For all the Philoſophers do with one Conſent confeſs, that their Tincture, when quite perfected and caſt in upon molten Gold, doth render the ſame brittle. And now ſeeing this Golden Blood of ours, being as yet immature, and not prepared, doth effect the ſame, would it not, I pray, perform the ſame much better, if it had but Ingreſs given unto it, by inceration, whereby it might flow the eaſier, and enter the more readily. I do not now at all doubt, but that this aureous Blood both can and in time will become an univerſal Tincture full of Medicinal Virtues.*

B. Al-

B. Although I am not minded publickly to diſcloſe an *Arcanum* of ſuch great moment, and ſo great a Myſtery, and to throw ſuch a precious Pearl afore Swine; yet I am of the mind to prepare ſome quantity thereof, and to part with ſo much unto the Sick that need it, and that ſhall deſire the ſame from me, as is requiſite for their Uſe. And not only to the Sick, but to others too, that are willing to apply it to other Uſes and Experiments; but eſpecially unto thoſe who would fain try, whether or no even this very Blood will turn it ſelf (according to my Deſcription) into a white Milk, and then into a Red Stone, and, by a new Reiteration of the work, paſs through all Colours. This deſireouſneſs, or inquiry after the Truth cannot at all prove any ways diſadvantageous to me, or mine. For the Art it ſelf will always remain an *Art*, unleſs it chance to happen, that ſome one or other Searcher, which is of a more ſubtile Ingenuity, ſhould, by his diligent and ſerious inquiry, ſearch out the very Foundation of the Art it ſelf. Which if it ſhould ſo come to paſs, he muſt then think, that God hath vouchſafed this Gift unto him, and that he now conſiders, and well knows, what eſteem he ought to ſet upon it, and by what means he ought to hide it. However, this is moſt certain, and indubitably true, that this Doctrine, and inſtruction of mine own preſcribed in my Writings, will be a ſpurring encouragement to abundance of Men (that have hitherto exceedingly doubted of the Truth of this ſo great a Myſtery, and ſhall now come to know it, laid open by me with ſuch evident Demonſtrations,) and cauſe them to ſearch with a greater and more ſerious ſtudy, and to caſt off all other unprofitable Coctions whatſoever. For to what purpoſe is it to uſe many things, about that which may be done by fewer and more eaſie. All things have their time, and ſo has this *Arcanum* too its own proper time. But we ſhall ſpeak more of theſe things in the following Deſcription of the ſecond univerſal Medicine. All theſe things which thou haſt hitherto ſeen, are indeed very good; but we are as yet far off from the end. Have you not likewiſe read in the Philoſophers Writings, that the white Swan doth alſo ſhew it ſelf in the Work? Now, if by but as yet *One* days ſhining, the Sun ſhall have illumnated by its brightneſs the Dragons Blood, you ſhall ſee it turned into a white Milk, which Milk the Philoſophers have written off, and which at length goes into a *Coagulum*, or Cheeſlike Curdling. Look therefore now upon that Milk, which you ſee to admit of Coagution and Condenſation, by little and little: And thus with this golden Cheeſe do we finiſh the Philoſophical Labour of the *Fifth* day.

A. *God be thanked, that this days Labour hath alſo ſucceeded, as we could wiſh. But foraſmuch as thoſe things which you mentioned, but now come in my mind,* viz. *that we are far off from the end of the work as yet, and yet too morrow is the Sixth and laſt day of this our Philoſophical week; and farther, ſeeing you ſaid preſently after the beginning of this our Conference, that the whole Work would be finiſhed in ſix Days ſpace, and that on the ſeventh Day we may ceaſe from all our Work and Labours, and ſanctifie it, or keep it holy, and give God due thanks for all theſe his Benefits beſtowed on us: Seeing* (I ſay) *that all theſe things come now in my mind, 'tis no wonder, if they likewiſe create in me a great deal of Care and Puzzling, to think, how this can be, that all thoſe things that remain yet behind may be perfected, and brought to a full end in one day.*

B. Ceaſe your Care [my Friend!] nor do you ought elſe this Sixth Day, but hourly encreaſe the Fire by Decrees, and ſtir it up more and more, that ſo you may ſee, by what means our white *Coagulated* Milk will by little and little paſs into a yellow Colour, and will at length be thoroughly Red, and abide moſt conſtant in the Fire. This fixed Redneſs, the Philoſophers call their *Salamander*: The Poets tells us a Tale, of a certain Worm that lives in the Fire, which cannot be burnt or conſumed thereby. Therefore, after the Philoſophers have brought their work through all the Colours, and have at length attained ſo far, as that there appears no other, but a mere fixed Redneſs, they named it their *Salamander*, with which (if you except only Inceration and Multiplication) they ended their work, and ſo do we alſo finiſh theſe our preſent Labours.

A. *Praiſe and Glory be to God, by whoſe Divine help, we have (by ſo happy and deſired a Succeſs) promoted our work to its moſt deſired end.*

B. Amen. And thus will we now put an end to our work, that ſo we may ſanctifie to morrow, which is the ſeventh Day, to the Honour and Glory of the Divine Bounty.

A. *Ah, my deareſt Friend; let me intreat you not to involve me by your immature departure, in greater troubles and difficulties. There are divers ſcruples and doubts, and thoſe weighty ones too, that perplex my mind, which unleſs you remove afore, your going away (but I hope you'l ſtay) I ſhall of a certain Truth be tormented all this enſuing Night with the moſt bitter Pill of Diſquiet and Anxiety, and then you may well gueſs with what mind I am likely to celebrate the to morrow Sabbath. For I am yet as plainly ignorant, what uſe to put that* Salamander *to. As concerning thoſe things, which you have faithfully diſcloſed unto me hitherto, I truſt, I ſhall not err in their Operation, but as touching Inceration and Multiplication, in which, as in two Cardinal main Points, the very [Pillar or] hinge of the whole Operation lyes, as you ſaid, I muſt needs confeſs my ſelf more Blind, as to them, than* Tireſias *was: I muſt needs ſay, that I behold the promiſed Land ſituate afore mine Eyes, but the way that leadeth thereunto is hedged in with ſuch Thickets, and ſo many Brambles, that I do not ſee which way I ſhall extricate my ſelf out of them. Unleſs the mercy of God, and your help come in to my aſſiſtance, I ſee that all my Labours will be in vain.*

B. 'Tis no ſmall trouble you bring me, by your importunity, don't you ſee the approaching Evening. You Act juſt according to the Cuſtom of importunate Men, who having once gotten ones out-held Finger, do ſnatch in the whole hand. At firſt, you only entreated me to diſcover unto you the Matter and Key of the Art, and ſaid, that you would eaſily find out the reſt your ſelf. Why then do you not ſeek thereafter, and let me go?

A. *Good Sir, be not diſpleaſed with this my importunity, proceeding from the too earneſt deſire, I have, of knowing ſo great a Secret: And Chriſt himſelf ſaith, if ye ſhall knock, the Gate ſhall be opened unto you.*

B. Well, ſince I ſee, that I muſt expect no quiet from you, till you do likewiſe learn ſomething from me, concerning Inceration and Multiplication, I will in a few words ſet afore your Eyes, things of great moment. Look to it, that you liſten very Attentively.

A. *I do.*

B. Have you not read in the Philoſophers, when they ſpeak of Inceration, that the out-driven Soul is to be reſtored to the dead King, that the dead Body may be recalled back to Life, and that it, ariſing with a more glorious Body, and a more excellent Crown, may prove an helper to its meaner Brethren. The

Philoſophers words are, as follows. Here the Soul lets it ſelf down, and refreſheth the dead Body. For it is not ſufficient, that the King be deprived of Life and ſo left dead: No, no, for neceſſity requires, that its Soul be reſtored unto it, which may reſtore its Motion, and loſt Life, to the dead Body. Now, by how much the oftner, the Soul and Life is taken away from the King, and that which is taken away be again reſtored thereunto, which ſo much the ſtronger and more active Body, and ſo much the Magnificenter a Crown will he ariſe withal. By theſe few words have I laid open unto you, Inceration and Multiplication. But yet there are other ways of increaſing our fixt *Salamander*, and rendring it fuſible, *viz.* by the addition of Mercurial things, which, by their ſpeedy Flux and penetrating Property, do pierce into this our deſtroyed Gold, diſſolve it, and ſo bring to paſs, that there is made of them both (*viz.* of the deſtroyed Gold, and which admits not of any reduction, and of the Volatile *Mercury*) a certain fuſile midling Body, which ſaid Body, thus conjoyned of the two, is to be maturated by the bare Regiment of the Fire. And by this Maturation, is this univerſal Medicament rendred ſo fuſible, as to have Ingreſs into all the Metals, and to penetrate them.

A. [*But pray Sir,*] *Is not this way of giving a more eaſie Ingreſs and Flux to our deſtroyed, and irreducible, Gold, by the* Mecury *of Metals, more facile, and a nearer one than that aboveſaid way, which requires a great many Operations, by the reiterating of Inceration and Multiplication?*

B. Yes Verily, it is a ſhorter and eaſier way, as being void of many tedious Labours, for it needs nothing elſe, but that the *Mercury* of ſome Metals be put into ſome good ſtrong Glaſs with the inverted Gold, and be ſo brought unto Fixation. But yet this Medicament, that is on this wiſe wrought up with the ☿ to a conſtancy in the Fire, cannot extend its Colour ſo largely, as that, which is rendred fuſible by ſo many reiterated Operations, becauſe, in every reiteration, the Tincture is exalted and multiplied. And now, have you any other demands? if ſo, be brief, for the Evening approrcheth.

A. *Yes, Sir, there are many things, that I would ask about, but ſeeing that my importunity is troubleſome, I I will at preſent reſt content with thoſe things, I have heard. Only, this one thing more would I gladly know,* viz. *where I ought to ſeek for the Soul of the King.*

B. You muſt look, whither you have driven it, and there muſt you ſeek it, and, having found it, you muſt reſtore it to the dead King, and ſo you will again begin your Work, and you ſhall again bring it through all the Variety of Colours, like as you did at the firſt time. For when the Soul is reſtored to the Body, there is made a new Solution, which is to be again putrefied, that it may turn back; and then proceeding farther on according to the ſame way, as was done in the firſt Operation, there will appear all the Colours, and they too far more delicate than in the foregoing Labour. The *Crows head* will be Blacker, the *Dragons Blood* Redder: The *Lac virginis* Whiter, and the *Salamander* more fuſile, than it was in the firſt Operation. For by how much the oftner you ſhall repeat this Mortification and Vivification of the King, ſo much the more Magnificent, more precious, and more efficacious a Tincture, will you obtain. Believe it, and give God the thanks, and be mindful of the Poor, aſſoon as ever you are Maſter of your Deſires. Come to me again upon *Munday*, that I may alſo teach you (according to my Promiſe) the way of making another Philoſophical work out of the Poiſonous, Volatile, and black *Saturnine Magneſia*: And ſo farewel.

A. *In going away ſpake thus with himſelf, Praiſe and Glory be unto God, who hath thus, by the help of one Man, beſtowed on me ſo great a Grace. I now go home with a cheerful mind, and there will I moſt deſirouſly wait for* Mundays *approach, that ſo I may likewiſe get, from my Friend ſent me by God, that other work,* [*made*] *out of the Volatile and Philoſophical Gold. But this Operation, done with fixed Gold, doth pleaſe me wondrouſly well, eſpecially for this reaſon, becauſe, in every Reiteration, there do always appear the ſame Colours, which preſented themſelves to view in the firſt Operation. Who would ever have believed that ſo many, and ſuch excellent Colours lay hid in common Gold? And now, if this can be demonſtrated in the common Gold, what may be expected from the ſecret Gold of the Philoſophers, in which (they ſay) many more Colours lye hid than do in common Gold. 'Tis a common Proverb,* [*I confeſs*] *that he who ſeeks from another comes to know many things, but* [*uſually*] *renders himſelf ungrateful: But yet however, I cannot chuſe but propoſe unto the Man one Queſtion more, perhaps ſome ſweet refreſhing Solar Ray will ſhine upon me. My Friend! I am come again unto you.*

B. Well, tell me, what more you have to ſay unto me?

A. *As touching thoſe things which I have ſeen, I deſire no farther Information concerning them. But, it will moſt thoroughly ſerve my turn, if you will be but pleaſed to anſwer but unto one Queſtion, which I ſhall propoſe unto you: And that is this, Foraſmuch as almoſt all the Philoſophers, in the deſcription of their Stone, do tell us, That the King is to be conjoyned, and Radically mixed, with the Queen in a peculiar Mercurial Bath, that ſo from them an Off-ſpring more noble than the Father may ariſe: And ſeeing likewiſe, that the ſame Philoſophers do at large celebrate the Coition of* Mars *and* Venus: *My deſire is very great, to underſtand your Opinion concerning this buſineſs. For if there could happen, or proceed, any good effect from this Conjunction of Gold with Silver, or* Mars *with* Venus, *what need would there be of ſo many repeated Coctions of the Gold?*

B. This way, which you make mention of, is not unprofitable; and, to tell you the Truth, there are yet nearer ways, the which whoſoever enters into, will equally become a Maſter of great *Arcana*'s. I was willing to ſhew unto you the work upon bare Gold only, for this reaſon, *viz.* that you may ſee with your Eyes, and as it were feel with your hands, that thoſe moſt eminent Colours do lye hid even in bare Gold too; which is a thing, that ſcarce one of a thouſand would have believed. And now being certainly aſſured, about the lying hid of ſo great a Tincture in Gold, you may with the greater confidence ſet about your Operations.

A. *Still more and more doth a brighter light ſhine upon me, Nor can I enough admire, when I look upon the Roſey Colour of the Lyon, that out of ſo ſmall a Lyon, there ſhould proceed ſo great a quantity of Blood, coloured with ſo excellent and delicate a Colour, when as notwithſtanding, out of other much greater Animals, there is ſcarce extractible ſo much Blood, as to anſwer to the hundreth part of this Blood.*

B. What? do not you underſtand, by what means, ſuch an incredible quantity of Blood can flow forth out of ſo ſmall a Lyon? What, do you not know, that the whole Body of the Lyon, which is the King of all Beaſts, is nothihng elſe but the mere concentrated Blood of the heart, one half Ounce of which, being boiled in many hundred Ounces of water, doth turn all

that

that water into Blood, as you your ſelf have now ſeen with your own Eyes.

A. *I confeſs, that there have now been ſhewn to the view of mine own Eyes, ſuch and ſo great things, the like of which I never heard ſo much as one word of, from any others. No Body would believe me, and (which is worſe) mine Enemies, who are moſt vile Compilers of infamous Libels, would ſet upon me with ſtore of reproaches and lyes, and call me Sophiſter and Cheater, and would ſay, that I boyl ſome* Brafile *wood, or other Red colouring Stuff in water, and ſo ſell it for the Roſey Blood of the Lyon. And therefore, I have no reaſon to make ſhew of any knowledge of this ſo great a Secret.*

B. How? what will you be afraid to be a reporter of the Truth; and to manifeſt theſe great wonders of God and Nature. That very way by which I ſhewed unto you, that that moſt high Colour ariſeth out of Gold, by the ſelf ſame way may you be able to ſhut the defiled mouths of your Enemies. And if they will not believe, that there lyes hidden ſuch a Colour in Gold, they will be convinced by the ſaid Lyons Blood, which, being made bright hot in a ſtrong Fire, and afterwards boiled again in other water, will convert the ſame, as it did the former, into Blood, and this you may even do, as often as you pleaſe. By this it is manifeſtly evident, that the Blood of our Lyon is incombuſtible. And in our being buſied about thoſe Labours of ours, there preſent themſelves to our view, three moſt delicate Flowers: The firſt is, a *Violet*, dyed with a mixt red and Sky Colour: Then, the White *Lilly*; and at laſt, the immortal *Amaranthus* ſhining with a Scarlet dye. But why, immortal? For this reaſon, becauſe neither the ſtrongeſt Fire, nor the ſtrongeſt Corroſive waters can at all hurt it, or change its Colours. The *Amaranthus* is tinged with the higheſt and moſt conſtant Colour, beyond all other Herbs and Flowers, the which does not ſo ſoon vaniſh after the manner of other Colours, which other Flowers have, but abides conſtant for many years, inſomuch, that ſuch an Herb is kept both Winter and Summer, to make Garland and Poſies, or ſuch like, withal.

A. *If now any one could be ſo happy at laſt, as to enjoy that* Amaranthus, *he might preſent many pious Virgins, with Poſies and Garlands made thereof.*

B. If you are deſirous of uſing the Lyons Blood in your Operations, then follow *Paracelſus* his Doctrine, in his *Tincture of the Philoſophers*, where he teacheth, that the Roſey Blood is to be conjoyned and fixt with the white Glew of the Eagle; which way ſeems the neareſt for the obtaining of the univerſal Tincture.

A. *I am delighted with hearing of this: The Roſey Blood of the Lyon I have, but yet I want the white Glew of the Eagle; which if I could but get into my power, I would conjoyn them both together without any more delay, and bring them to Fixation. But I cannot ſufficiently enough admire at this,* viz. *that* Paracelſus *hath made no mention, of conjoyning the Virgins Milk of* Diana *with the Kings Blood.*

B. Paracelſus has not therefore injured any, in his not manifeſting all things ſo clearly and openly, ſeeing it is the Cuſtom with other Philoſophers to do the like: If you are deſirous to uſe Gold and Silver conjoyned together, in your working, then deal with the Silver, juſt as I taught you to do with the Gold, and make thereof an incombuſtible *Lac Virginis*, and ſuch as admits not of any Reduction; the which is to be conjoyned with the incombuſtible Blood of the Lyon, and to be put into a Veſſel, that ſo theſe two Bodies, being conjoyned, may be moſt conſtantly [or firmly] united, and may never be ſeparated from each other by any kind of disjoyning. But, that you may yet better underſtand the whole buſineſs, I will ſubjoyn a few words more. Our white Eagle being put in common Water, makes the ſame, wherein it is diſſolved, ſo tenacious and glutinous, as that, it can glew Paper or other things together; and, therefore it is not without cauſe, that this our ſecret Salt is termed by Philoſophers, the Glew of the Eagle. For thoſe things, which this Glew joyns together, can never more be ſeparated from each other, and this is one mutual Bond, by which the Husband and the Wife are ſo linked together, that they cannot ſeparate from one another. It doth not much differ from the tye of Marriage, by which, the Husband and the Wife, or the young Man and Maid, are by Gods Command ſo knit and bound to each other by the ordinary Miniſter of God, that nothing but Death can ſeparate them. If now a Man and Woman joyn themſelves together without the legitimate and publick Bond of Matrimony, they beget illegitimate Children, and can (when they pleaſe) break that Conjunction of theirs, and depart the one from the other, becauſe they are not coupled with that Marriage, that proceeds from the Command and Will of God; which ſaid coupling or Matrimony is in repute, and is generally obſerved for a common Cuſtom, and as being the Will and Command of God, not only amongſt us *Chriſtians*, but likewiſe amongſt *Jews*, *Turks*, and *Heathens*, throughout the whole World. And for this reaſon, the Philoſophers were pleaſed to introduce the like coupling or Marriage in their work, and that not only of *Sol* with *Lune*, but likewiſe of *Mars* with *Venus*: Which Copulation, if wanting in theſe two laſt [*viz.* ♂ and ♀:] their conjoyning cannot have any good and happy Succeſs, as daily experience witneſſeth. But now if *Mars* and *Venus* be coupled by a Prieſt in the lawful Bond of Matrimony, they likewiſe bring forth legitimate Children, and ſuch as may be promoted unto Kingly Dignities. I could yet kindle more light unto you here, concerning this our Philoſophical Copulation, *viz.* by what means the moſt inconſtant, and moſt highly Volatile, things may (by the Operation of the ſame) be ſo conjoyned, as that they can never afterwards be looſened from their inſeparable knitting together. But at the preſent you are not capable of bearing any more. Whatſoever hath been now omitted, by reaſon of the ſhortneſs of time, ſhall be made up at our next meeting and Conference. But, one thing more comes in mind, which I would have you to know; and 'tis this. When you would make any good thing of *Mars* and *Venus*, you muſt in an eſpecial manner beware of their groſs Bodies, which are Leprous and unfit for our work. 'Tis their Blood you muſt ſeek after, the Blood, I ſay, of their inmoſt Heart, and the true Soul that lyes hidden in that Blood, which is ſo very near a kin to the Royal Blood. And now, that you may enjoy ſuch a moſt noble Blood, you muſt not imitate the Country fellows, who, thruſting a knife into the Hogs necks, do ſave that Blood that flows out from thence, to make Puddings withal, and take both good and bad Blood together. No! You muſt therefore in the firſt place, know for a certain Truth, that you muſt ſeparate out of that groſſer Blood of ♂ and ♀, that moſt ſubtil Arterial Blood of the Heart, without which Separation, you may not expect any good ſucceeding Event. Which ſaid Separation, ſeeing, I know, that you are ignorant of, I have thought good to ſet it afore your Eyes, which more clear and more perſpicuous Expreſſions. [Know then] that that moſt pure Blood is never gotten by any other means

means, but by the Corruption and Deſtruction of the Venereal and Martial Body: By which helps, theſe, ſo groſs and hard Bodies are in ſuch wiſe opened, that the inmoſt and moſt ſubtil Blood may be drawn out of them. But yet, ther's no need of deſtroying their Bodies by *Aqua Fortis*, ſeeing that Nature her ſelf exhibits unto us their Bodies already opened, in *Vitriol*, and hath left no more for us to do, but the Labour of extracting the moſt pure part thereout of. For even in the common *Vitriol*, *Mars* and *Venus* are found conjoyned by Nature. And now, when we would draw thereout of the moſt pure Blood, ſuch a *Vitriol* is to be choſen, which never hath been as yet in the Fire; this, *Vitriol* is to be diſſolved in water, and to be filtered and ſeparated from all its Feces. This green *Vitriol* contains hidden in its ſelf, the Blood of that green Lyon, out of which, the ſaid Blood is to be extracted by the help of a certain Magnet, that ſo the unprofitable and groſs Body may remain behind. For 'tis the Spirit that vivifies, the Body is unprofitable. But now, in your extracting this Blood thus pure, you muſt not be too greedy, but have a Care, that you extract no more than a little of the beſt Blood: Which if you do not heedfully mind, you will alſo extract together with the pure Blood, the more groſs and more impure, and ſo your work will be ſpoil'd. For you need only the beſt and moſt ſubtil white Blood of *Mars* and *Venus*. For, like as the ſubtileſt and nobleſt Blood of all the Animals is not Red, but White, [*viz.* the Sperm:] Even ſo, the Blood of *Mars* and *Venus*, which comprehends the Virtues of the whole Body, and the true propagating Seed, is tincted with a white Colour, in the ſearch of which, 'tis expedient we beſtow our Labour. Therefore, after that we have extracted, by the help of our Magnet, ſome two or three half Ounces of white Blood, out of twenty Pounds of *Vitriol* diſſolved in water, we then take it our, leſt it ſhould alſo extract the moſt groſs Blood too, when it can find no more of the white Blood unextracted. You had therefore need be cautelous in the extraction of that Tincture, and be circumſpect in the Accompliſhment of the ſame. For we are taught by Nature and Experience, that, in the Coition of Male and Female there doth naturally concur a white Blood to the Propagation of their Off-ſpring, and in defect of that, Nature is conſtrained to ſend forth a vile and red Blood. Therefore, we muſt here endeavour, with our utmoſt Care and Induſtry, to purchaſe by our extraction the moſt pure Whiteneſs, and not the moſt groſs Redneſs. For in that white Virgins Milk lye hidden all Colours, and the higheſt Redneſs. This white Virgins ~~Milk~~, you may promote to a Fixity and Conſtancy, in a pure clean Glaſs, without the Addition of any other thing, the which, after its being dryed, will become black, and will be tranſlated out of the black Colour into ſeveral others, and at length ſhines with the higheſt Redneſs, which puts an end to the Operation.

But as concerning our Magnet, ſeeing you know it already, you will not need any farther inſtruction about it. You have thus heard my Opinion about *Mars* and *Venus*, and have underſtood, by what means ſome good thing may be thence had. Neither muſt you perſuade your ſelf, that there is any other way of having any benefit out of them; how great is the number of thoſe, who by their vain Labours have mightily endamaged themſelves, following the Writings of *Biſilius*, in which he teacheth to make a Red Oyl out of *Vitriol*, which he calls Gold Philoſophical The bare literal Strife is not always, and every where in his Writings to be taken. There is no doubt, but that no ſmall benefits are to be had out of *Vitriol*. For the Philoſophers themſelves do hint forth unto us, the benefit therein hidden, in theſe words: *Viſitabis, Interiora, Terræ, Rectificando, Invenies, Occultum, Lapidem, Veram, Medicinam*; *You ſhall Viſit the inward parts of the Earth, and by Rectification you ſhall find an hidden Stone, a true Medicine.* And now at laſt, to cloſe up this our Conference with ſome profitable Admonition, know, that I would have thee forbear from the troubleſome Coction of the imperfect Metals, by reaſon of the too many impurities, which create many Moleſtations in the Separation of them, and cauſe much loſs of time. 'Tis better, that you take in hand *Sol* and ☽ to perfect the Work withal, which Metals do moſt abundantly contain in them, the Red and White Tincture, and are already freed by Nature from moſt of their impurities. And although, I have not as yet made the univerſal Tincture out of ☉ and ☽, yet there hath appeared unto me ſo much, from ſo many, and ſuch various Operations, that I do not in the leaſt doubt, but that the immortal *Amaranthus* may be made out of them; whereunto you may boldly give Credence, without doubting at all.

The COROLLARY, *Or, Preſent over and above.*

IN this Dialogue, the Dragons Blood is ſo deſcribed, as if it needed full ſix whole days Operations, to be perfected and brought to its full end, nor did I then know any nearer way. But afterwards, there became known unto me a nearer and more compendious Proceſs, whereby I can now (Praiſe and Glory be to God for the ſame) in a few hours time introvert and tranſmute the diſſolved Gold, and reduce it into a Red Blood, and that by the help of one only certain White *Urinous* ſublimate, concerning which, I have treated more at large in the fifth Part of my *Pharmacopea Spagyrica*. And upon the ſame Account have I likewiſe written, that the ſaid of Blood of Gold muſt [needs] at length get an eaſie Fluxibility and Ingreſs by the frequent Iteration, or Abſtraction of the moiſt Spirits from the dry Gold. But foraſmuch as the Multiplicity of ſuch Abſtractions is not only full of laborious Operations, but alſo chargeable and requires much time; and that the ſtudious Searcher after ſo great a Secret, may not by being affected with the Tedioufneſs of ſo many toylſome Operations, be quite weary, and at laſt throw off all hopes: I do therefore commend unto every one, that other and nearer way of getting it a Fuſibility and Ingreſs, *viz.* the inceratting it by *Mercury*, by the benefit whereof, he will far ſooner and eaſier arrive unto his purpoſe and final Scope. And although I have hitherto been hindred through want of time, beſides (many other impediments) from having compleatly finiſhed the Operation of the ſaid Tincture. Yet notwithſtanding, I do with an aſſured and undoubted confidence affirm unto every one, that there is given a moſt certain occaſion [or Capability] of the making and finiſhing it, and that by the hitherto deſcribed way. I bequeath to ſuch of our Poſterity, as are of a Good, Sincere, and faithful mind, thoſe things which I have wrought with mine own hands,

Conf. 5. *Part Sp. Ph. p.* 149.

and

and withal to what iſſue I have brought all my Operations. It is free for every one (as time and occaſion ſerves) to make Tryal about attaining unto the wiſht for end. For my part, I do heartily thank God, that he hath vouchſafed unto me the Ability of plentifully and abundantly preparing the Lyons Blood, and of performing no ſmall matters therewith in a Phyſical way: And therefore I ſhall be well content, though I never arrive unto the deſired end of finiſhing the Operation of the univerſal Tincture.

The Second Dialogue, or Conference, Or a Continuation of the precedent Colloquy or Dialogue, treating of the Preparation of an univerſal Medicament out of the black venemous and Volatile, Saturnine Magneſia.

A. *BLeſſed be the name of the Lord, who hath cauſed another Day to ſhine upon me. I will preſently haſte to my faithful Maſter, and will beg from him the Doctrine of the ſecond univerſal Medicament, that he promiſed unto me.*

All hayl t'yee, my deareſt of Friends! God Grant that this Day may prove happy and lucky to me and you: I am come hither to hear from you, if it ſtand with your Conveniency, to make good your Courteous Promiſes at this preſent, and to teach me the making and Preparation of your ſecond univerſal Medicament: For I have an exceeding ardent deſire, to know the manner of Preparing it, out of that Volatile and poyſonous Mineral.

B. I thank you for your good Wiſhes, and wiſh unto you the ſame you wiſht me. Look here, here's a piece of our venemous *Saturnine Magneſia*, which is the true Matter, that the Philoſophers Stone is prepared out of.

A. *I pray, is this black ſtone the true Matter, out of which is wont to be made the univerſal Tincture, and Stone of the wiſe Men? Verily I much wonder, that this ſhould be the Gold of the Philoſophers, I am extraordinarily deſirous of ſeeing, by what means ſo excellent a Medicament, and ſo noble a Tincture can ariſe out of ſo baſe and venemous a Body. I ſhould rather adhere to that old and common Proverb, and ſay, Who can waſh the* Blackmoore *white, which Nature hath generated Black? This now ſeems unto me more eſtranged from the Truth, than that which you propounded laſt week of the common Gold. For how could it ſeem at all likely to any ones bare reaſon, that ſuch a Body could be brought into a nothing, and again reduced unto a certain Body: But time will inſtruct, whether this be poſſible or not. I will therefore very patiently wait for the Event of thoſe things, which you ſhall ſhew unto me.*

B. What? Still more incredulity, and do you anew produce [and Practiſe] the Faith of unbelieving *Thomas* [*viz.* to ſee and feel afore you believe?] What do you think, I would go about to perſuade you, that you have a wooden Noſe ſticking on to your Face? Alas, Sir! my time is a little more precious than ſo, to ſpend it in an unprofitable Tattling. And that time which I now beſtow upon this our Conference, is ſpent to this end, to free you from your unbelief, and to bring you unto a true and evident Credency; to the performance of which, I am ſtirred up by the Authority of the Sacred Writ, which Commands, that we reclaim ſuch as err, into the right way, and that we ſhall receive from God this reward for our Labour, *viz.* our Star ſhall ſhine in Heaven brighter than others. Beſides, Chriſtian love requires the ſame at our hands, that we do good to others. And foraſmuch as I have well known your Chriſtian like Converſation, and Godly way of living theſe many years paſt, why ſhould I deny you the things you demand, or wind you into the Intricacies of a greater Labyrinth, ſeeing you have but too long ſtuck in them already? The things which you cannot at firſt underſtand or believe, the end will at laſt conſtrain you thereunto. Your part is to liſten very attentively to all the words, I am about to ſpeak. For I can eaſily take away from you all incredulity, and remove out of your mind every Scruple of doubting. How ſourely you look upon this black Mineral, well, but you ſhall preſently find, that all the moſt delicate Colours of the whole World are moſt abundantly found therein; and by the help of an Art deſcribed by the Philoſophers, they will appear one after the other in Operation, even from the Black head of the *Crow*, to the Red *Salamander*.

A. *Bleſs me, what an ardent deſire have I to ſee theſe things?*

B. Have you not read in the Philoſophers, that the pure is to be ſeparated from the impure, and the purer part is to be ripened? Separate, ſay they, the pure from the impure, and bring it to Maturity. And they call Separation, the waſhing away of the Blackneſs, which being waſht off, the Whiteneſs preſents it ſelf to view? The Fire (ſay they) and *Azoth* waſh *Laton*; *Laton* ſignifies our black Mineral: *Azoth* ſignifies their ſtrong *Acetum*, which wetteth not the hands. This *Acetum*, as well as our *Salarmoniack* [afore-mentioned] hath its Riſe from common Salt. Both of them, as to the external ſhape, and taſte too, and Efficacy and Virtue are in a manner juſt alike. With ſuch an *Acetum* is our black Matter diſſolved into a Snowy-white, pellucid and very clear, water, as you may here ſee. This water have the Philoſophers called their *Mercury*; In it, are hidden all the Colours that are in the whole World, but yet not viſibly evident, afore that this water, or this *Mercury* be put upon the water, [I believe he means, upon the Fire] and be cheriſhed by little and little, like Hens Eggs, which cheriſhing drys up the water by little and little, into Earth, and renders the Colours viſible one after another, as you ſhall preſently ſee.

A. [*Good lack,*] *who would ever have believed, the things which I at preſent See? Our Mercurial water hath been ſcarce three Days in digeſtion, yet begins to change it ſelf into a White Milk. And now it is* [*but*] *the eighth day, and this ſaid Milk goes into a* Coagulum *or Curd, and within in the Glaſs about the Edges* [*of the Matter*] *there ſhines a delicate Redneſs, but yet I believe it is not fixt or Conſtant.*

B. Pray, how can it be conſtant, ſeeing it does but repreſent the *Dragons Blood* and will preſently be gone.

But, proceed you but on with this firſt Degree of Fire only, and that little and little, until the whole water be turned into an aſhy Colour'd earth: When this is done, we will encreaſe the Fire by little and little, one Degree more, which will leiſurely turn the aſhy Colour into a Black one.

A. *I will uſe my utmoſt diligence and obſervancy.*

B. Do you ſee now that ſleeke and ſhining Blackneſs like the Head of the *Crow*, covered over with abundance of black and very ſmall Feathers: And upon this Account, the Philoſophers have called this thus appearing Colour, the *Crows* head. To this black *Crows* head, adminiſter the third Degree of Fire, which will tranſmute this black head into various, moſt delicate Colours, ſhining like ☉ and ☽: Then continue on this degree of Fire, that all the ſaid unſtable Colours may vaniſh, and may preſent to view the white Colour. After Whiteneſs, follows Yellowneſs, which at laſt will be covered over with the conſtant and permanent Redneſs: Which appearing, the fourth Degree of Fire is to be adminiſtred, that that Redneſs may be more and more exalted, and waxing Redder may attain unto its due Fixity and Conſtancy; the which, by way of ſimilitude, the Philoſophers call, a *Salamander*, and is the end of our whole Work.

A. *I ſhould never have ſo much as dreamt, that ſo black a Body could in ſo ſhort a ſpace of time have been tranſmuted into a moſt pure Whiteneſs, and that this ſame Whiteneſs could, by an admirable paſſing through all Colours, paſs into a moſt delicate Redneſs, but I pray, when this Matter hath obtained this Redneſs, is it to be accompted of, as an Univerſal Medicine?*

B. Yes, Verily, becauſe all the curable Diſeaſes of Men, may (by that ſame Matter) be reſtored to former Health; and that ſafer, better and perfectlier than can be done with any Herbs, or any other known Medicaments. I except that Medicament, which is extracted out of this, and concentrated into a much nobler Nature. But, as concerning the Tranſmutation of Metals, it yields not any Profit, afore it be made fixt and conſtant in the Fire; to the effecting of which, there is required a ſufficiently great ſpace of time.

A. *As far as I can underſtand, there may be a yet better and profitabler Medicament prepared, than this is.*

B. Yes, Verily, that there may, a much better and more uſeful, becauſe that with this, there are as yet admixt many unprofitable Feces, which ought to be ſeparated therefrom: And the Caſe is far otherwiſe in the perfecting of this Work out of this Mineral, then in that which is done with Gold, for this is all over defiled with many impurities: For every one muſt needs think, that there are abundance of Feces [that are to be] ſeparated from that Mineral, and by how much the more impurities are ſeparated, ſo much the more efficacious muſt the Medicament it ſelf of neceſſity be. Now in this preſent Degree and State it is brought unto by us, it would be ſufficient for all kind of Diſeaſes; which if we would yet have to be far more efficacious and ſtronger, it would be expedient, that we ſeparate yet the more unprofitable and uſeleſs Feces, and concentrate the more pure Eſſence into a more narrow Room and leſſer Body. For 'tis the Soul only or Quinteſſence of things, that heals Diſeaſes. The ſhells or husks bring no Profit at all, and this the Husbandmen well know; for they ſeparate the husks and chaff from the Corn, afore they bake Bread. The Medicinal Virtues of Herbs and Minerals are but of a ſmall weight, afore they are freed from the Bonds and Fetters of their Bodies: But now, after that they are ſeparated from their Bodies, they can perform incredible effects even in a moſt ſmall quantity, and ſuch as the great weight of that Body, whence they are extracted, will never effect. Look but on a living Man that is in good Health, with how ready and nimble a Motion can he ſtir his Limbs, and what ſtrength he can put forth: But as ſoon as ever the Soul ſhall have ſeparated it ſelf from the Body, how inſenſible and immoveable the Body lies, and not ſerviceable for any Uſe? It is therefore a certain and undoubted Truth, that the Life of all things wanteth weight, and this ſhall be more clearly, and more evidently demonſtrated by the Concentration of this univerſal Medicament. For that which one Ounce, now, does, of this thus prepared Medicament; half an Ounce, when concentrated, will perform the ſame: And that which half an Ounce of this Medicament once concentred will effect; one quarter part of an Ounce, or a Dram of the ſame twice concentrated, will effect the ſame. And according to this compute, may you proceed on farther. For by how much the oftner the prepared Medicament is concentrated, ſo much the more Feces are ſeparated therefrom: And by how much narrowlier the Virtues are contracted, ſo much the greater effects do they produce. And thus there needs not in a manner any weight in Medicinal uſe. That which ten Grains of an unconcentrated Medicament is wont to accompliſh, you will effect the ſame with one Grain of the Medicine, when concentred, to be put either in Ale or Wine for ſome hours, if need be, or elſe held in the Mouth. For ſoe it will no leſs diſplay its occult Virtues and Powers, than if the Powder of the not concentrated Medicament had been otherwiſe drunk down. Beſides too, ſuch a Medicament may be a long time uſed without loſing of its Virtues, and that not only inwardly, but outwardly alſo in all Wounds, Ulcers, and ſuch like external affects. For all new Wounds, as alſo old Ulcers whatſoever they be, are happily cured by the laying on of thoſe Medicaments, if the ſame Medicines be likewiſe uſed inwardly. Nor needs there here many *Emplaſters*, *Cataplaſmes*, and Ointments: Concerning which thing, ſee more in the Fifth Part of my *Pharmacopœa Spagyrica*, where the uſe of this Medicament is treated of.

Read alſo thoſe things, which that moſt excellent Philoſopher *Van Helmont* declares of another certain Philoſopher, *Butler* by Name, *viz.* that he had a certain Stone, at *London* in *England*, which being ſweld a very little in Oyl Olive, rendred the ſame exceedingly Virtuous, that ſome few drops thereof taken into the Body, would drive away the moſt grievous Diſeaſes, and being outwardly applyed to Wounds [or Sores] would ſpeedily heal them. Theſe things *Helmont* teſtifies to be true, as being an Eye witneſs of the ſame. But I do not attribute ſuch incredible Virtues unto my Medicament, for as much as I my ſelf doubted of this Story of *Butler*, and could not believe, that any Medicament could be promoted to this ſo high a Degree of powerful Efficacy: But now, ſeeing I perceive that it is poſſible to Art, for the Virtues of things to be contracted into a narrow Room, and be concentrated; I do upon good ground caſt this doubting off from my mind, and adhere to thoſe things which I ſee with mine Eyes, and touch with my Hands. Certain, and firmly undoubted it therefore is, that not only the Medicinal Virtues and Powers of this our Matter may be contracted into ſuch a narrow Compaſs, as to effect an hundred fold more in Medicine, than that more groſs Body could do: But alſo this

may.

may be acquired or effected too, *viz.* that hidden Colour or Tincture in our black *Magnesia* may likewise be concentrated, together with that Multiplication of Virtues; insomuch, that in the several Concentrations, the Colour of the concentrated Body may be exalted, the which, most high Colour, or exalted Tincture can never at any time be gotten, without our secret Concentration: For otherwise, if there were no need of that Concentration, it would necessarily follow, that that *Magnesia* of ours would be no other than a most pure Body, not at all needing any ablution of its gross, and unprofitable, and black impurity: But this is not so, as we said afore about the Gold, which is pure in its own Nature, and of it self void of all Defilements, and being a ripe Body and mere Tincture, needs no other thing, than this, that its inward Parts be turned outwards, and its outward Parts inward, by that Philosophical introversion, and that so its external Yellowness may betake it self inwards, and the internal Redness may come forth outwards, or (to speak the more clearly) that the manifest Yellowness may be hidden, and the hidden Redness may be manifested. But now, the Case is not thus with this our black Earth, and impure *Saturnine* Mineral; in the which, both good and evil, pure and impure, Poison and Medicine lye mixt together: Insomuch, that it is altogether necessary to separate the black and gross impurity, from that noble and tender Medicinal Pearl, and to reduce it unto Fixity.

A. *With gaping Mouth, and open Eyes, do I even swallow down your Discourse, and yet I cannot pierce into the Foundation of the whole business, nor understand it. You speak of such an artificial Concentration, and which is beyond all my apprehensions, for I never in all my whole Life time heard any thing of it, as far as I remember, much less read ought concerning it.*

B. I will set before you then a Similitude, that so you may the readiler understand the knack. Examine well, and consider, Wine, Ale, or the Lees of Wine; and by your searching you shall find, that there is in them but very little of the Corroborating Spirit, or Soul, the remainder is nothing else but mere impurities, destitute of all Virtues. Now if some Physician or other should administer to his Patient a large Cupful of Lees, to cheer and comfort his heart withal, would you not accuse him of ignorance, and Folly? For though there is somthing of comforting Virtues in the troubled Lees, yet it is impeded, or clogged, by the great quantity of the dreggy Lees, from rightly performing its proper Office. But put Case, that it could display its own Virtues, yet nevertheless, even the admixt impurity would also exercise its own accustomed Evil, and so the Good would be confounded with the Evil, or rather be quite over powred by the same. For this reason, there is nothing more necessary, than that the good be separated from the evil, before any thing be used about making *Medicine.* Therefore even as there are Workmen to be found, who, by the vulgar Distillation and Rectification, do separate the Heart-refreshing Spirit out of the sordid Lees of Wine and Ale, and bring it unto use, give the remaining filthy dreggs and useless Feces to the Hogs to eat: Even so do we (the Lovers of the *Spagyrick* Art) separate the pure Virtues and Powers of things from the gross, sordid, and noxious impurities, afore we administer them to our Patients.

A. *As concerning these Sayings of yours, I am clearly of your Opinion, and withal do stick close to that common Proverb, which saith, Speak that which is Truth, eat that which is baked, and drink that which is clear, if you be desirous of a long Life. For my part, I delight to have the Kernels, and purged or cleansed Fruits, and willingly leave the husks and shells to the Swine, that are delighted with Bran and Chaff, and their own Dung.*

B. I am extreamly satisfied, that I have already (thanks be to God) seen the whole Work, and have a sufficient thorough understanding of the whole Basis of the same, *viz.* that the purer and subtiler part is to be separated from the more impure and grosser part, and, by an often repeated Separation, and artificial Concentration, to be advanced into a most subtile, most pure, and most noble Quintessence, if any one has a mind to produce effects of some great moment, or to do more than common things. And now, as you have learned, from the words of our precedent Conference, the way of making an universal Medicine out of common Gold: So have you likewise again received, from this our present discoursing together, the Confection of the universal Medicament, out of our *Saturnine Magnesia*, which is the *Root* of the vulgar Gold. But, although both of these Medicaments are, as *per se* and singly alone, very excellent and effectual enough, yet notwithstanding it plainly, and clearly appears unto our ken, that the power and Virtues of both the universal Medicines admit of being promoted unto a far higher Degree; the which thing we see is possible to be done by the means of Conjunction, and is to be thus understood. When a Seed is implanted into its own growing Root, it attracts out of such a Root, which is of its own kind, or Nature a far better, and more nourishing Alimentary juice, than out of the gross Earth. For example, The Seed of a *Rape Root* being put in the Earth, produceth *Rapes* of the same bigness that the *Rapes* were of, from whence the Seed came: And as often as you shall commit that Seed (by sowing) to the Earth, you shall, notwithstanding, never have greater and better *Rapes* than those, from whence the Seed was taken. But now, if the Seed of some *Rape* be sown into some other *Rape* which is in the Earth, and which hath grown unto the half of its bigness already; that Seed will sprout forth, and grow up like as the other Seeds planted in the Earth will do, but yet sooner, because it finds a better Nutriment in its own Mother, than that does, which is planted in the bare Earth: And hereupon, it must necessarily produce a greater *Rape Root*, and from the greater Root will proceed a greater Seed. And this is the reason, that there are such great grown *Rapes*, which make every Body wonder at them: Some such I have seen, that weighed ten, twelve, yea and twenty Pound weight. If you have a mind to try, sow a few *Rape* Seeds, throwing them into the Earth, which when they shall have grown to the bigness of an Egg, take a wooden sharp stick, and make therewith a small hole, even into the middle of the said *Rape*, and then put thereinto your *Rape* Seed, and stop up the hole with soft [clammy] Potters clay, that so the Rain may not get in and rot the Root. Thus now, that Seed will also (as being in its own Root) grow up out of this *Rape*, existing and growing in the Earth, and will dilate that its Root, and advance it to a greater bigness. The Reason's this, because it can attract unto it self a better and more convenient Nourishment from a Root of its own kind, than out of the bare Earth. And if you shall practise thus with other Seeds likewise, you will effect the same, as with this. *N.B.* From the Seeds of small *Radishes*, implanted into great *Rape*

Rape Roots, there grow huge *Radiſhes*. This kind of Propagation may not unfitly be likened to a Mothers ſuckling her Infant, which attracteth and draws its Nouriſhment from the Mothers Breaſts: But the Mother it ſelf receives her Nouriſhment from the Fruits of the Earth, and that, being changed into a ſweet Milk, ſupplies the Infant, whereby it is ſuſtained and nouriſh'd. But that I may lay the whole buſineſs afore your Eyes, by a more full Declaration, I will yet farther add one Similitude more. Take you ſome wild and not yet ripe Stock of a *Pear*, *Apple*, *Cherry*, or ſome other Fruit-bearing Trees, ſuch, I ſay, as is not yet full grown, but is as yet conſtituted in its firſt tender Age, take off from it all its Boughs, which bear [but] a wild and ſower Fruit, and Cut it all off even unto the bottom, and to the Stock ſtanding out of the Earth plant a *Cion*, pluckt off from another Tree that does not bear wild Fruit, into this Stock, betwixt the Bark and the Wood of the ſame, where 'tis cut off with the Saw, and fence it well with Wax, or tenacious Clay, *&c.* againſt the Rain: If now you ſhall thus do, and do your work Gardner-like, that fruitful *Cion* will draw unto it ſelf the wild Juice, out of that wild Tree or Stock, and make it better, ſo that it will no more bear any wild Fruit, but ſuch as that Tree did bear, from which the *Cion* was pluckt. If now, ſo ſmall a *Cion* of ſome cultivated and fruitful Tree can ſo change the wild Juice of a wild Stock, that it becomes far better, and more noble: Why, ſhould not Gold do the ſame in our Metallick Tree, when ingrafted in Lead as in its proper Root? Verily in my Opinion, there is not a better Earth (from which that golden Seed may attract unto it ſelf an Alimentary Nouriſhment, and ſo multiply it ſelf even to infinity) to be had, than its own proper Root. But yet, with this Proviſo, that all the groſs and degenerate Boughs be firſt cut off from that ſame groſs Root, for ſo, it will the eaſilier and readilier change its wild and degenerate Juice, (when joyned to the golden Seed or *Cion*,) and ſo will be changed into a far nobler, and produce Fruits a thouſand fold. You ſee, my Friend! what good Will I bear to you, in that I have ſo faithfully opened unto you all thoſe things which I thought neceſſary to be known, for the perfecting of ſo great a Work. Ponder well in your mind, upon the Similitudes of the *Rape* and *Cion*, and believe, that what I have here ſpoken is not caſually and at Random. For they have more hidden under them, than they ſeem to ſhew for, and than you would imagine. Length of time will open your Eyes, which are as yet blinded, as to abundance of things, (if God permit.)

A. *Surely, Sir, I cannot chuſe but wonder anew, when I accurately conſider the things you have declared unto me, of changing the wild Nature, of the wild Vegetative Fruits into a tame, mild, Property: And that ſuch a Tranſmutation of the ignobler Nature, into a more noble One, takes place alſo in Metallick Affairs. They are verily ſuch things, as are of weighty Concernment, and moſt worthy a moſt accurate Conſideration. But, indeed, who can ſufficiently enough conſider of all the Divine Miracles? Bleſſed be his moſt holy Name for evermore.*

B. Amen.

A. *I give unto you, for your courteous inſtruction, moſt hearty thanks, and remain obliged unto you all my whole Life. And thus with what hath been ſaid, I commit both you and my ſelf to Gods protection.*

B. My deareſt Friend, I have now performed the Promiſe I made unto you, and am not meanly delighted, in that you have underſtood the meaning of thoſe things, which I have ſaid unto you: But yet I cannot but admire, that you are not Covetouſly deſirous of knowing yet more, and that you do not Crave an yet more prolix unfolding of more matters. For you well know, that you cannot every day have the Enjoyment of my Company.

A. *For thoſe things, which I at preſent received from you, do I return you moſt hearty thanks, another time God will vouchſafe more: The greateſt deſire I have at preſent, is to ſet about ſo great a Work, and to have the Fruition of the hoped for Fruit. If you are ſo minded, and bent upon doing Friendly Favours, I do requeſt you, that you would oblige my Brother by your good turns, if he ſhall hap to come unto you, and Petition for ought at your hands, for you may aſſiſt him in ſome ſmall, yet good,* Arcanum: *For he hath been ſtupid, or unapprehenſive enough hitherto, and much needs ſome accurate inſtruction. But what ſhall I ſay? The ſick looks after the Phyſician, he that is thorough Well has no need of him. Such things as are hard to be underſtood, exceed his Capacity: The more eaſie things are more commodious. And ſo again, Farewel.*

The COROLLARY.

I Have taught in this Dialogue, *That the White Lac virginis* (after its being extracted, by Diſtillation, out of the Black *Magneſia*, and after its Exaltation, in Virtue and Efficacy, by Rectification and Concentration,) *is to be freed from its ſuperfluous Humidity, and yet the dry Matter is to be made permanent in the Fire, by the gradual Operation of the Fire.* Now for the more accurate Declaration ſake; theſe things which follow ſhall be yet farther ſubjoyned.

That Fixation, if it be to be perfected by the [bare] help of the common Fire, requires a long and tedious time, ſo that there's no reaſon for a Man to perſuade himſelf, that he can finiſh the ſame in one years ſpace. I ſpeak by my own experience, for I my ſelf have tryed, and find that it cannot be, that one year ſhould ſuffice for the finiſhing of this Fixation, for indeed it requires a much longer time. For after that, I had ſo far advanced the Matter, that it had paſſed through all the Colours, as to flow when put upon a Red hot Plate, and to inſinuate it ſelf thereinto, like Oyls penetrating into a dry Hide, yet was it not fixt enough nor conſtant, nor ſerved it for the tinging of the Metals, but when a vehement Fire was applyed thereunto, away it went in ſume; but yet not without an evident Demonſtration of the poſſibility of the ſame. For as much therefore, as it does not yield that ſatisfactory Fruit, [and Succeſs] and ſeeing that ſuch great Labours are not undertaken, without the expectation of ſome Profit, and that the hoped for Fruits cannot however be gathered, afore that the ſaid matter is promoted to a perfect Maturity, and conſequently dreads not any the moſt vehement Storms of the Fire any more; any one may eaſily conjecture, that there needs (as I ſaid afore) a more tedious ſpace of time for this Fixation, if it be to be done and perfected by the common Fire of Coals. But now, he that has the knowledge of the ſecret Fire, of the Ancient Philoſophers, ſuch an one will much eaſier, and ſpeedier, arrive unto the wiſhed end of the Operation. The Nature of the vulgar and fugacious Minerals doth very difficultly and ſlowly admit of that Fixation, which

which is made with the Fire of Coals: And this I was unwilling to conceal from the diligent Searcher after the Secrets of Nature; yet farther adjoyning this Admonition, [*viz.*] that a very profitable Medicament may nevertheleſs be prepared in a ſhorter ſpace of time, and an appearance made of the admirable, and highly delightful Variation of abundance of moſt delicate Colours. For the firſt Colour that appears is like the black head of a *Crow*, preſenting it ſelf to view like the Colour of black Glaſs. This blackneſs going off by little and little, gives place to the White, and pondrous Maſs; which is called by the Philoſophers, the *White Swan*, and not without reaſon, becauſe that ſelf ſame white Matter is not ſo compact and Stone-like, as that black *Crows* Head, but is porous, and not much unlike unto a kind of heap made of abundance of ſmall and white Feathers. When this Whiteneſs is turned into a Yellow, thoſe Feathers vaniſh, and the Maſs returns to its former Compactneſs, and reſembles the form of a yellow Stone: Of which if you put a little piece upon ſome Red hot Silver, or Copper-plate, it will at firſt ſtand like a Red blood, and afterwards penetrate the Copper-plate, and tinge it both within and without with a white Colour; but yet, ſomewhat brittle as yet, and yields in the *Cineritium*, or *Cupel*, ſome Silver, and operates in Medicine ſomewhat effectually, like the white Stone, but yet weaker. It likewiſe pierceth into a Silver-plate, like as Oyl into a Skin, and tingeth it with a yellow Colour, which being ſeparated by the *Cupel*, and diſſolved in *Aqua Fortis*, leaves excellent Gold in the bottom. I have not as yet made any farther Progreſs on the Operation, being quite tired, and weary of ſpending any longer, and more tedious time thereabouts, which however was neceſſarily requiſite to the perfecting of this Tincture with the Fire of Coals. But yet I have by me all the Colours as they follow on after each other, which I can ſhew unto any one; whereby they may ſee with their Eyes the moſt evident poſſibility of Nature: To which end alſo I am minded to preſerve thoſe Tinctures by me, that they may be an everlaſting Memorial of ſo great a thing, unto my Poſterity: But for my part, I will commend [to every one] that ſhorter way of bringing the work to the wiſhed end, by the Mediation of the ſecret Fire of the Philoſophers: Concerning which, the following Dialogue, and the *little Book of Fires*, treats. For the immature Firſt *Ens* of Gold, cannot be excocted [or digeſted] into the deſired Tincture by any thing more eaſily, than in its own proper ſecret Fire; and not by a Coal Fire.

And that it may clearly appear, that I have written the Truth, I will ſend unto ſome of my Friends (God willing) ſome of thoſe white and yellow Stones, to be uſed not only in Medicine, but in *Alchymy* too; that ſo they may make tryal and experimentally find, that Tinctures have a Power of bettering, and amending Metals, afore they have arrived unto the half part of their Fixation.

The Third Dialogue, or Conference, betwixt B. and C. treating of the true Univerſal and particular Medicine of the ancient Philoſophers, (extracted) out of ſuch Gold as is yet fugacious, or Volatile, and immature; (and is) to be ripened by their ſecret Fire; which Operation is by them ſtyled, the work of Women, and play of Children.

C. *GOOD morrow heartily, my Friend! I wiſh you a good and proſperous Day.*

B. I wiſh you the ſame, whence come you to us ſo early?

C. *I have very earneſtly for theſe ſeveral days waited for this hour, that I might ſee you, and have the Fruition of the moſt ſweet Fruits of your Courteous inſtructions. My Brother* A. *ſent me hither, and told me, that you had given him leave to ſend me unto you this day. I do therefore Friendly requeſt you, that you would put a good Conſtruction upon this my Boldneſs.*

B. [My Friend!] I do not in the leaſt take it ill, your Brother told me, that you were as yet ignorant and unskilled, in the more ſubtil *Arcanaes* and Secrets; and that you therefore needed not ought elſe, but ſome pretty eaſie Secret, which might be eaſily underſtood, and performed with ſmall Expences, and yet be profitable and beneficial unto you.

C. *Indeed, Sir, to tell you the plain Truth, ſuch* Arcanums *as are profound ones, and to be penetrated into by a ſubtil Meditation, and which are of great moment, do far outreach my duller apprehenſion: And therefore I do not at this time deſire any thing, more than this,* viz. *that I may obtain ſomething that is not coſtly, and yet may effect ſo much in Medicine and* Alchimy, *as may ſerve me to live a little more commodiouſly and plentifully, as to Food and Raiment. And that you would be pleaſed, to render me a Maſter of this my deſire, is my humble requeſt unto you, again and again.*

B. You do very prudently meaſure out your requeſts, according to your own Capacity. And indeed, ſometimes, thoſe things which are not Coſtly, nor are difficult in their Operation, are more profitable to a Man, than thoſe things are, which they would fain get by the expence of a great deal of Charge, of a long time, and hard Labours: I will grant you your Requeſt, and therefore hearken.

C. [*Sir, I thank you,*] *and do liſten.*

B. Have you never read, or elſe heard from others, that thoſe moſt ancient Philoſophers, tell us that their univerſal Work, is not only moſt eaſie to be done, but withal no ways Chargeable. For they do openly Confeſs, that to the perfecting of their Work, a Man needs be at no more Expences, than two *Florins*, and that the Labour it ſelf, even from the beginning to the end, is nothing elſe but mere Womens work, and Boys play.

C. *You are pleaſed to offer me delicate Dainties, eaſie to be prepared, for I have not ſo much Money as is to be laid out upon thoſe kind of chargeable and coſtly Labours: Neither will my Family Affairs admit thereof,* viz. *to ſpend my days in ſuch ſumptuous and chargeable Cookeries,*

and which are ſo full of moſt great Labours, and whoſe event too is oftentimes very uncertain. For I have heard ſome ſay, that the ſmalleſt Errour may deſtroy the whole Work, and quite ſpoil it, and ſo grievouſly affect ſuch as operate about ſuch great Secrets, with a very great loſs of long time, and great Expences. And therefore ſuch a Work, as I can attend upon without letting my taking Care of my Family, and which will need the diſburſment of but a few Expences, will pleaſe me better than thoſe other Coſtly ones would.

B. I readily believe, that this very thing you deſire, will not only be exceedingly pleaſing unto your ſelf, but alſo unto many others beſides. The Expences are but very ſmall, and the Labours thereupon but little, ſo that each days Fire, which the Matter is to be ſet upon, may be taken Care for, in half an hours ſpace. But now, though the Philoſophers have made mention of very ſmall Expences, and have compriſed them in the compaſs of a couple of *Florins*, yet is that ſaying to be otherwiſe underſtood. Thoſe Ancients made uſe of the greateſt *Florins*, *viz.* the *Rheniſh* ones, and alſo the *Hungarian* Crowns, each of which is of the value of five of our *Florins*. And if you thus underſtand it after this compute, I can eaſily ſhew unto you the Truth of their Aſſertion.

C. I do even think as you ſay: Sure we muſt not expect any [ſuch] things for nothing; I am content, [and therefore, pray] let us proceed.

B. If our Work be called the labour of Women, and Boys play, it is expedient, that it be like unto Womens work, and Boys play: For elſe the Philoſophers would have uſed an unfit ſimilitude. You well know, what Labours your Wife is chiefly buſied about, and what her daily Labour is ſhe imploys her ſelf in.

C. Yes, verily I daily ſee, that ſhe doth boyl Food neceſſary for the Uſe of the whole Family, and being boyl'd ſets it upon the Table to be eaten. This Labour ſhe performs, at leaſt twice every day; when Dinner and Supper is ended, ſhe doth waſh the Diſhes, Pots, Goblets, and other Veſſels, and cleans them, and makes them fit to put other new Food in, and to be ſerved out to the Table. Beſides too, this is her Office and Care, if haply a Pot be broken, or crackt, whereby it is made unfit to hold moiſture any more, to ſubſtitute (in defect of Iron Pots) a new Pot made of Potters Clay, in the ſtead thereof: Such and the like Labours, as theſe, are in our Country called the Womens work.

B. Well, be it ſo: I will likewiſe ſhew unto thee, ſuch a Labour in *Chymical* Operations, as reſembles this. Therefore, like as the Female Sex do firſt waſh the *Fleſh*, *Fiſh*, *Rapes*, *Pot-herbs*, *Roots*, *Apples*, *Pears*, or other things with pure Water, which they mean to boyl, and then put them into the Pot, and pour thereunto as much Water as is requiſite, and place it over the Fire, and boyl it ſo long, till all the crudity, or rawneſs being vaniſht, the Meats become grateful to the Palat, and pleaſant, and eaſily digeſtible by the Stomach. [So do we] They do likewiſe ſometimes pour Wine upon Fleſh and Fiſh, inſtead of Water, and add as much Salt as is convenient, together with ſome Spices, or odoriferous Herbs, by which they give the Fiſh and Fleſh a moſt excellent Taſte. But yet we muſt not forget Salt, above all the other Spices, or Seaſonings, and odoriferous Herbs, for it Corrects and maturates the Fleſh, Fiſh, and other hard Meats, more than other Spices. For we can well enough want theſe if they are not at hand, but as for Salt, there is always need of that, about the boyling of Fleſh, Fiſh, and other Food. If therefore Fleſh, or Fiſh are to be boyld well, then Salt water is requiſite; and as for all the other Additions of Herbs, and odoriferous Spices, they only ſerve to give it a good pleaſant Taſte, and make it acceptable to the Palat, and to the Smelling. For the Fleſh and Fiſh when boyl'd or ſtewed, do by their Magnetick Virtue attract ſo much Salt and grateful Savour, and Virtue, as they need: And that which remains, ſtays in the Water. Now the curious Dames do ſhut the tops of their Pots very well with their Covers, leſt the efficacious Vapours ſhould be forced away in fume by the Boyling, and not ſtay with the Fleſh or other Meats. But the careleſs Houſewifes do not much regard the covering of their Pots, from whence it comes to paſs, that they loſe theſe good and ſweet Spirits, and then they fil up their Pots with new Water, by which doings, the Fleſh, or Fiſh, do not get ſo ſweet a Savour, as they would have, if that efficacious Water had been kept in and conſerved. Some Women that are yet more curious, and diligent about their Cookery, do put upon their Pots, wherein they boyl their Meats, ſuch a Cover as hath a fold in it, by which the Collected ſweet and odoriferous Vapours may diſtil down into an under-put Veſſel, which being thus gotten, they keep by them, to refreſh and cheriſh with them, ſuch as are weak and ſick, when need requires. Others, to free themſelves from this kind of Labour, do add as much Water as need is, together with Salt and Spices, to their Fleſh, and ſo boyl it by little and little, ſhutting in the Vapours with a Cover, which elſe would go away, and the Meat taſte of burning. And by doing thus, they are not neceſſitated to pour on any new Water, though this ſlow boyling takes up more time than that, which is done by a ſtrong and unceſſant Ebullition: I would have you well to obſerve theſe things, for 'tis not without cauſe that I utter them. And now let us examine the other ſimilitude, and ſee what thoſe Boys Plays are, that ſo we may afterwards accommodate even them too, to our Philoſophical work. What therefore do you ſee concerning the Boys Plays, with what things, and after what manner do they Play?

C. How can I tell? They play as their Parents pleaſe to let them, or as they can get opportunity of Playing: As for my ſelf, I do not grant my Children ſo much Liberty, to play when, and how they liſt themſelves. I ſend them to the School and to the Church, and ſometimes I allow them one hours Play for Recreations ſake, nor do I allow them any other Play but at Bowls, [or Knickers] by which they moderately ſtir their Bodies, and exerciſe themſelves, and Concoct their Meat, and this is far more profitable for them, than if they were conſtrained to ſit always at home, without any exerciſe at all: Other play than this, I allow them not. Cards and Dice are unfit Plays for Boys, they are many times very hurtful to thoſe of riper years, eſpecially when by the too much abuſe of them, they do ſo unprofitably waſte their precious time, and cannot tell how to uſe a mean. I have indeed otherwiſe ſeen Boys, that meeting with ſome Sand get [thereout of] bright Stones, and play with them, but yet this is not uſual. However, there is no play more frequent amongſt Children, than that of Bowls, [or Knickers] which play they daily uſe, whatſoever time they can ſteal, to that purpoſe. Yea both at their going to School, and returning from School, you may ſee them preſently buſied about their Rubbers, or Knickers-play. They are very hardly reſtrained therefrom. If they want Money to buy the Bowls, or Knickers, they get a little piece of Potters Clay and moiſten it with Water, and make up their little Bowls, or Pellets in their hands, and harden them

in

in the Fire; which I remember, when I was a Boy, I often did. And beſides this Boys play, no other is known unto me.

B. Very good, you have hit the nail on the head: And now let us ſee, whether or no the ancient Philoſophers have (after the manner of Boys) played with ſmall Bowls, or Knickers? and whether, or no, they have boyl'd their work in Pots, with as eaſie a Labour, as Women do. For of neceſſity they muſt have hit on doing after this wiſe, elſe could they not have compared their work to the Labour of Women, and play of Children. So then, if we are to imitate Women and Boys in our Operation, what Matters are we to make uſe of, for our boyling, in the ſtead of Fleſh, Fiſh, and other Meats; and what Water is it, that is to be poured thereupon. For if we are minded to do any good effect, 'tis expedient, that we likewiſe know, what thoſe Matters are, which admit of being boyled unto a Maturity in our fiety Water, and theſe verily muſt be ſuch, (ſeeing they are to be *maturated by boyling*) as have a great Affinity with the ſaid Water: Foraſmuch therefore, as our Water is of a *Metallick* Nature, and yet all the Metals do in a manner ariſe, or proceed (in the Earth) therefrom, and are even at this very day advanced, by the very ſame (by the help of the Terreſtial and Central fire) by little and little unto perfection: All that we have to do is, to imitate the ſimplicity of Nature, which will never ſeduce us, for ſo without queſtion, thoſe moſt ancient Philoſophers did do, who having borrowed their wonderful Work from Nature her ſelf, do adviſe us to do no more, but to follow Nature, and to begin there, where Nature left off, and to aſcend higher and to make that perfect, which is as yet imperfect. God hath prefixed unto Nature her bounds, which ſhe cannot tranſgreſs [or go beyond:] But Art, doth much excel Nature, and performs thoſe things which Nature cannot accompliſh: Yea more, that which ſhe can hardly do in the Earth in a thouſand years time, Art effects in one year, and this is eaſily confirmed by many Teſtimonies. Now as to the Generation and Maturation of the Metals, Nature uſeth a moſt ſimple or plain way, a very ſlow one, but yet ſafe. From thence ariſeth the Errour of many a Man, who do not follow Nature, but the guidance of their own phantaſtick Brains, never effecting ought of good, but remain always Novelliſts in the ſame, what Labours ſoever they undertake, and what Expences ſoever they are at: Although the ancient Philoſophers do by their many Admonitions ſet afore us, that moſt ſimple Courſe of Nature for us to imitate; and they have eſpecially hinted to us, that their Work is ſo ſimple, that ſhould they but openly and clearly have treated of the ſame, even the Women would deride it and ſay, that the Male kind had learned their Art from them. Yea, it is ſo very vile a Work, that no Body would be able to believe it, and upon this Account, the Philoſophers have done their utmoſt, to hide and obſcure the Art the moſt they could, leaſt they ſhould be contemned by the proud deriders, (who Soaring aloft ſeek after things too high for them,) and be accounted for Cheats and falſe Writers. And this is the main and chiefeſt Reaſon, why this Art being ſo wrapt up in darkneſs of a moſt profound Silence, lyes hitherto hid from the whole Troop of Sophiſters, and ſuch deriding Fellows. *Sendivow* (as we have already ſeveral times hinted) doth expreſly ſay, that he had oftentimes declared the whole Art, to not a few word for word, unto whom, that Art did nevertheleſs ſeem ſo very vile and mean, that they could not at all believe any likelihood of Truth in his moſt true words, and ſo left the Work unattempted. The ſame *Sendivow* doth alſo ſay, That had the moſt skilful *Hermes*, the moſt quick-witted *Geber*, and moſt illuminated *Lully* been again alive, and beheld our Laboratories ſtored with ſo many, and ſuch various Inſtruments of Glaſs, Earth, Iron, and other Matters, and ſuch ſeveral Fornaces, they would be raviſhed into a moſt high Admiration, like ſo many Boys, and would be but as it were our Scholars, as concerning thoſe Veſſels and Fornaces; all which however, we have learned from their Writings, but yet we are deſtitute of that moſt excellent Work which was wrought by them in ſo ſimple a Way, and it hitherto flies our ſubtile and acute Wits. And, my dear Friend, he alſo tells us, that we ſhould fly aloft into the lofty Air with our Wings, for the Work is ſimple, vile and abject, the which, you may ſooner comprehend [or feel] with your hands, than apprehend by the ſubtilty of your Wit or Cogitations.

C. All theſe things may very ſufficiently ſerve to rid us out of ſo great a Labyrinth; but I pray, Sir, how comes it about, that we do ſottiſhly perſuade our ſelves, that thoſe things are ſo very difficult, which notwithſtanding are ſo very ſimple, vile, and abject.

B. It is indeed, to him that has knowledge of the ſame, an eaſie, vile, and ſimple thing: But very difficult and intricate to him, that laying aſide the way of Nature, thinks himſelf able to learn ſo great an Art out of Books, which (by their leave) though, ſeems a thing almoſt impoſſible to be done. For the Philoſophers have ſo prolixly, intricately, and obſcurely deſcribed the whole Myſtery, that their ſo prolix and dark Writings would ſooner lead a Man from the true and right way, ſo far off are they from reducing him thereinto.

C. I my ſelf find, that this is moſt certainly true, for I never heard as yet of any Man, or read of any, that learned the Art out of Books: But that almoſt all of them who were ſkilled in the ſame, do Confeſs, that they became Maſters of the ſame, either by Divine Inſpiration or Revelation, or by the help of ſome Friend. There's no Body can contradict thoſe things which you have here induced, for the Confirmation of your Opinion. And now, Sir, let us ſet upon the Work it ſelf, and diligently pray unto God and wait for his Bleſſing.

B. Content, hearken therefore attentively.

C. So I do.

B. Did you never find in the reading of the Philoſophers, that all the imperfect Metals may in a *Particular* way be promoted to the perfect Maturity of Gold or Silver, by their dry Water which wetteth not the hands: But being not content with this effect, they have promoted the firſt *Ens* of Metals (by the help of their occult, fiery, and ripening Water) to a more than perfect Conſtancy, and Fixity in the Fire, and have concentrated it to the form of Gold.

C. I remember, that I have read of ſuch things as theſe, though by reaſon of my unskilfulneſs and ignorance, I could not underſtand the leaſt Particle of their meaning: For I am altogether ignorant of that kind of wonderful, and yet, to every Body well known Water: And ſo ſhall ſtill remain until it be ſhewn (and pointed at) with the Fingers.

B. Look here, here's a piece of admirable Water which is every where in all places eaſie to be found, yea, in the pooreſt Country-mens Houſes, nor doth it deny any Man, the Poſſeſſion and having it.

C. Who would ever have believed, or thought, that there was any good hidden in ſo vile and abject a Body?

[*B.* I

B. [I wonder] wherefore [it is] that no Body can think of this Matter, ſeeing it is evident, that in our Water the firſt Entities of all the Metals are abundantly hidden, as in their own proper Seed, out of which they are generated in the Earth, and ripened unto perfection. Thoſe firſt Entities are but extracted out of this our Water, by [peculiar] Magnets. And now, like as every Metal hath its own Magnet, even ſo every one [of them] hath its proper Magnet, by which it is concentrated into a narrow Room. I will declare unto you the Truth of this buſineſs, by an example taken from the Metals. If you have a Water fully impregnated with Copper, and you deſire to have Copper out of the ſaid Water, you will eaſily bring this to paſs, if you ſhall but put in to that Water, which holds in it the Copper, a piece of clean Iron, the which Iron, (as being the true Magnet of the Copper,) will attract unto it ſelf, all the inviſible Copper out of the Water, and gather it into a viſible and palpable Metal. If Silver be diſſolv'd in any Water and made inviſible, and you would again have it, put into the Solution a Plate of pure [or clean] Copper, which (after a Magnetick manner) will gather together [or draw out] all the Silver in his own [Silvery] Body, and make it viſible and palpable. Now when Gold is diſſolved in ſome Water, and largely diſperſed, [as I may ſay] and you would again have it [in the form of Gold;] then put in ſome ☿ or *Ar. vive* in that Water, and boyl it a little therewithal, (as was done above, with the Copper and Silver) and you ſhall preſently ſee all the Gold to be attracted, and gathered together by the *Mercury*, inſomuch that there will not remain ought of the Gold in the Water, becauſe it follows the Attraction of its own Magnet, *Mercury*. Theſe *Metallick* and *Magnetick* Operations, are a ſufficiently manifeſt Information unto us, and do point out unto us (as with a Finger) the way, of the extracting, not only good Metals in a *Particular* manner, but alſo far better things than Metals, (*viz.* the Tincture, or form of Gold) out of our ſtinking Water, in an *Univerſal* way, by ſuch Magnets, as are fit and apt in Nature for this Extraction. Another ſimilitude we have from the Earth, and Rain water, with which the Fruits of the Earth are moiſtned: Put you in ſuch an Earth moiſtned with that Water, as many Seeds as you pleaſe; each of them, will (by its *Magnetick* Virtue) attract unto its ſelf, its own like, for its Multiplication, and will leave to the other Seeds, to attract each of them its like alſo. If now, by this ſimilitude, the Scope or end I aim at, may be made manifeſt unto you, there is yet hopes you may be holpen: If not, I do not ſee, by what means you can be ſuccoured, foraſmuch as it would be too tedious here to uſe many other Circumſtances. For when we are certainly aſſured, that the firſt *Ens*, or the very Form of Gold is plentifully hidden in our Water, we do by very good right ſeek after that beſt part, *viz.* the form of Gold, and leave the other firſt Entities of the reſt of the Metals, in the Water. And now Ile ſhew thee another ſimilitude: Diſſolve in one and the ſame Water, ☉, ♀, ♂, ♃, ☿, that ſo you may have all theſe Metals commixt together in the ſame: If now you deſire to extract the beſt of them, *viz.* the Gold there out of, what hurt will the other bring you, if they remain in the Water. Such therefore as the Magnet is, which you put into that ſame Water, ſuch is the Metal too, that you ſhall extract. If therefore we particularly ſeek ☉ and ☽ in our Water, it will be expedient, that we put unto this ſpiritual ☉ and ☽ their proper Magnet, unto which Magnets, they (being precipitated) do ſtick on, and are by little and little fixed [on thereunto.] And now if we ſeek after ſomething better than ☉ and ☽, *viz.* the form and Tincture of Gold, it will be neceſſary, that we alſo apply ſuch a [ſuitable] Magnet, which may draw out nothing elſe but the Tincture or Form of Gold, which being precipitated [thereout of] may be fixed. And thus have I here told you all thoſe things that are neceſſary to be known. If you are minded to extract in a *Particular* way, *Sol* and *Lune* out of the Univerſal Mineral water, you muſt then put unto them their Magnet, *viz.* an *Amalgama* of Copper, and *Argent vive*: For the Copper draws to it ſelf the ſpiritual Silver, and the ☿ the ſpiritual Gold, out of the ſaid Water, and brings it unto a Fixation [or Corporeity] with it ſelf, [or, as it ſelf is.] But if you are minded, or deſirous, of getting ſome better thing, than the Gold it ſelf, or Silver, is, *viz.* a Tincture, you muſt then needs adjoyn thereto its own peculiar Magnet, for, without it, you cannot effect any thing at all: But that you may know, what the true Magnet of the Tincture is, I ſay unto you, *That is the Compeere, or Companion of our Water, and not of the Metals:* For like ſeeks its like, as the Philoſophers ſay, Nature rejoyceth with Nature, Nature overcomes Nature, Nature retains Nature: More than theſe things I have told you, it is not needful for you to know: Conſider therefore very accurately what I have ſaid, and beg of God by your Prayers a bleſſing, which if you do, you ſhall not err, but yet you will not be all of a ſudden Maſter of what you deſire. All theſe things have their determinate times, like as a Grain of Wheat ſown in the Earth, the which requires a time to ripen in, nor doth it wax ripe afore the time appointed for Maturation be come about. Follow you the Advice left by *Geber*, and do not haſten on your Work, by any the leaſt haſty ſpeed: For he tells us expreſly, that all haſtning in our Work is of the Devil. And as concerning what is to be known, and what a one the Student of ſo noble an Art ought to be, you will find deſcribed in the Fifth Part of my *Spagyrical Pharmacopæa*. And what think you now? Can you thoroughly underſtand me?

C. *Yes, Verily, I do well enough underſtand thoſe things which I have hitherto heard from you; But yet this Womens work, which you began a Declaration of, is not ſufficiently clear unto me, nor is that Boys-play, which is done with ſmall Bowls or Knickers, I do not thoroughly underſtand that neither,* viz. *how it may be compared with the work of the Philoſophers. Were but theſe things made clear and evident unto me, I would Ranck my ſelf amongſt the number of the Maſters of the Art.*

B. Well then, come let us go on and ſee, by what means the Philoſophers are wont to make their little Bowls. [Note!] Like as the Boys make uſe of Earth and Water, for the making of their Pellets or Knickers: So likewiſe will we uſe our Earth, and our Water to the making of our ſmall Bowls or Pellets: Ours, I ſay, not the vulgar and common Earth and Water, for they are unprofitable as to our Work. But tis indifferent, and all one, whether we take Yellow, Red, or white Earth, becauſe all of them are of one and the ſame Nature. According to the Colour of the Earth which we uſe, will the Colour of the ſmall Balls we make, be: We have here at hand a threefold Earth, a yellow Earth of Gold, a white of Silver and a Red of Copper. This threefold Earth will we moiſten with our Water or *Mercury*, and ſo make up a Paſte or Maſs of the two, which the *Chymiſts* call an

Amalgama.

Amalgama. This Paſte will we waſh with pure Water, grinding it ſo long 'twixt our Fingers, till there be no appearance of any farther impurity, and that it admits of being eaſily waſht, or broken with the Fingers. Being thus well waſht, we will put it in a Skin, or Cotton, and tye it firmly in; out of which, we will ſqueez forth all the ☿ with our hands, and ſeparate it from the ſaid Earth, juſt in ſuch a manner as *Argent vive* is ſeparated in *Amalgamations*, or *Metallick* Maſſes. The *Mercury* being ſeparated, we will take out our thick *Amalgama*, and make ſmall Bowls, or Knickers thereof, and of almoſt the ſame bigneſs, that the Boys Knickers are of. Theſe Bowls we will expoſe to the Air, for about ſome twenty four hours, and by this time they will be grown ſo hard, as to reſemble Stones, in hardneſs. And now, being thus made ready for boyling, we will put them into our Water to ſeeth: But yet in the ſeething, there muſt be an accurate regard had to ſome skilful handling the Matter, if you would have it perform its Operation without Errour. This Art will I faithfully open unto thee, leſt you err, and ſo bring damage upon your ſelf: Theſe Pellets, or little Bowls thus made of our Maſs, are not to be thrown into the Pot filled with Water, afore the ſaid Water boyls: Which boyling, you muſt throw them in one after another, and they will preſently harden themſelves, and cover themſelves over with an hard Cruſtineſs or Skin, by which they will be prevented from ſticking to one another, and from coming altogether into one Maſs. For if you firſt of all put your little Balls into the Pot, and then afterwards pour cold Water upon them, and ſo ſet them on the Fire, that they may be boyled unto their Maturity, you will ſpoil your whole Work. For before the Water in the Pot be hot, all the Pellets being diſſolved, would run together in one Maſs, and ſo would not admit the Humefying, or moiſtning of their inſide Parts, and ſo you would turn all your Pellets by your ſeething into a mere Pouſe or Pottage, whereas they ſhould remain whole in all their Parts, as well internal, as external, for fear of drawing the Water in. But that you may have an accurate Account of all theſe things which I have ſaid unto you, I hope you will ſet about the Work, [or thus,] I hope you will do your beſt, heedfully to regard all theſe things which I have ſaid unto you] and I ſuppoſe, that you have ſufficiently underſtood the things which I have already ſpoken: But if ſo be, you do not yet apprehend the meaning of theſe things, I will Counſel you, by what means you may learn this Operation at home from your Wife. When you are come home, bid your Wife to make you ſome little Balls, or Dumplins with Flower and Veal. And heedfully obſerve, what Courſe ſhe takes, about making ſuch Balls, that ſo you may by the ſame way learn to deal with your *Metallick* Pellets. Firſt of all, you ſhall ſee, that ſhe puts ſome pure Flower into a deep Diſh or Platter, and having put it in, ſhe works it into a Paſte, or Maſs with Cream, or the pureſt Milk. Then ſhe admixeth ſome green Herbs ſmally minced, and ſome Spice medled among, and ſprinkling ſome Salt thereupon, ſhe mixeth them with the Paſte made as aforeſaid, to give it the ſweeter Smell, and Taſte. Of this Paſte, ſhe will afterwards make little Balls, of what bigneſs ſhe pleaſeth, which Balls ſhe does not put in the Water afore it boyls. When therefore the Water ſeeths, ſhe throws in, one Ball after another, each of which, as ſoon as ever it feels the fervent heat of the boyling Water, will preſently cover it ſelf over with a Skin, whereby they will be kept from ſticking one to another, and running into one Maſs, and returning into ſuch a Paſte as they were in, before their being made up into Pellets: Whereas, now each of them may be kept in its own Form, and be encompaſſed all round with the Water, and be advanced unto a Maturity, or readineſs, by a due ſeething: And now, when you have ſeen this Operation of your Wives Cookery, I do not queſtion, but that you will be well enough skilled in this Cooking Art.

C. *My deareſt Friend, I do friendly requeſt you not to take it amiſs, in that I cannot abſtain any longer from down right laughing, when I hear that our work hath ſuch a correſponding likeneſs, with the Art of Cookery: Your ſo faithful Inſtructions have already abundantly ſatisfied me: I have very often ſeen my Wife buſied about the Cooking of ſuch Balls, and my ſelf have alſo delightfully fed upon theſe kind of Dumplins, made both of Veal, Eggs, and Spices, and alſo of Flower, Milk, and green Herbs. But I fear me, that when my Wife ſhall ſee me making theſe Balls or Pellets, and boyling them in a little Pot, ſhe will laugh at me, and ſay, that I learned my Skil from her.*

B. 'Tis no Matter, you have no reaſon to regard either the tatling of your Wife, or of all Men whatever: For they know not what they do, it is enough for you, that your ſelf know what end it is, you do any thing for: Think you, that if other Wiſelings and Know-littles ſhould ſee you working with ſuch little Balls, they would not deride and mock you. But don't you at all mind their unprofitable Prating, leave the ſhril-ſounding Geeſe to their own loud Chatling, and follow you my Doctrine, and wrap up this our Cookery Art in the darkneſs of Silence: Which if you do, you need not fear of being mockt, or laught at by either Women, or Womaniſh Men.

C. *I have now (praiſed be God) learned enough: But yet, there is one thing I am ignorant of, and that is this, by what ſign I may come to know, when my Pellets are well enough boyled, and what Fire they are to be boyled in. The Fire of Wood and Coals, I know is uſed by the feminine Sex for to boyl withal, but whether or no, the ſame be neceſſary and conducive to our Operation, I requeſt you to inform me.*

B. Have you never ſeen, what proof Women have to know, when their Dumplings are well boyled? They are wont to take one out, and cut it in twain, that they may ſee, whether or no the inſide, as well as the outſide of the ſame be ſo well ſeethed, as that the Flower is not any more tenacious or Clammy: Do you even the ſame, and ſometimes put a piece of one of your Pellets you take out, in the *Cineritium* or *Cupel*, and that will ſhew unto you, how much increaſe of *Sol* and *Lune* hath particularly added its ſelf to your Balls, in that time of the boyling, and how long they are, as yet, to be boyled. Now you know, that all theſe things are to be ſearcht into, by your own Meditation and Tryal, becauſe it can not poſſibly be, that all things can be ſo very clearly ſet afore ones Eyes, as to need no farther meditating thereupon, and inquiſition thereinto. After this manner may you boyl in one Pot, with one and the ſame Water, two, three, or more little Bowls, of different kinds, as, ſome made of Flower, green Herbs, Spices, Fleſh, Eggs, Fiſh, and other things, and ſo, after the ſeething of them, you make take forth one kind after another, and *Particularly* apply them to your Uſe. For theſe things are to be underſtood concerning *Particulars*. But if you have a mind deſirous after the *Univerſal* Medicine, then muſt you enter upon a certain way of almoſt an whole entire year,

which is neceſſarily requiſite to the finiſhing of its Operation. For our Magnet, whoſe Task it is to extract the *Form* of the Gold out of our Waters, doth as yet groan under its immaturity, and therefore needs no ſmall ſpace of time, for the extracting the *Tincture* out of our fugacious and combuſtible Waters, and fixing it with it ſelf.

C. *Theſe Words of yours, by which you mention ſo long a time, do not a little affrighten me. Our Wives can boyl their Dumplins enough in one hours ſpace; what will ſuch a continued boyling coſt? I would be glad to redeem it, [or, to be excuſed] for the price of two Golden pieces of Money [or Duckets.]*

B. I ſhould tell you, that you are of the Off-ſpring of unbelieving *Thomas*, for you heap upon your ſelf, by your needleſs incredulity, ſuch heaps and Loads of Cares. Don't you remember, that I told you at firſt, that the Charges of the whole work, from the beginning to the very end, do not exceed two Golden pieces of Money, which they call Duckets. And that I do not at all tell you an untruth, I will expound it unto you by an evident Demonſtration. When you ſhall heat your well covered Pot, that ſo your Water may not vaniſh away in fume, with the ſmall fire of a Lamp, how much I pray will ſuch a Labour coſt you? Put Caſe, that ſome Pounds of water coſt you ſome *Aſſes* or *Stivers*, and the Magnet doth alſo coſt you ſome *Stivers*, [ten *Aſſes* are a *Roman* Peny, which is Seven pence half Peny of our Money] and now how many Pounds of Oyl will there need to nouriſh that ſo little a Fire? And though you ſhould ſpend forty, fifty, or more Pounds of Oyl, may not you well ſay, that you ſhall finiſh the whole work, for the Charge of two Golden Duckets. Well! what ſay you? Are you yet Content?

C. *You do now again ſomewhat encourage my mind, which had almoſt fainted, by telling me, that the Matters neceſſary for our Work are ſold at ſo mean a Price. But there's one thing ſtill that doth not a little trouble me, and that is, that ſo much time is required to the Fixation. All the other things are as well as I could wiſh: But, I would fain have had that ſhorter work of three hours, or ſeven days.*

B. O thou Dreamer, what have I to do with thee? What? doth that ſpace of time, wherein ſuch excellent and moſt profitable Fruits are to be hoped for by thee, ſeem too long? What doſt thou think to get without length of time? Good things are not wont to offer themſelves without Proceſs of time, as the common Proverb tells us. Mean while you may follow your Vocation, nor needs there any other Labour, than that you look to your Lamp Morning and Evening, and ſee how the Fire is. And I pray, are not the Country men conſtrained to wait their time, wherein to reap, and again to receive the Fruits which they committed to the Earth? And though they have ſown their Seeds afore the approach of the Winter, yet they cannot reap them again from the Earth, ſooner than the next following *Auguſt*, which then rewards and recompenſeth all their hard Labours. But now, the waiting ſo long a time does not tire them; for they patiently expect the time of Harveſt. Thus likewiſe are you to do, but if you are greedily deſirous of ſooner making ready your Pellets, or Balls, by the boyling, you may I Confeſs, have a ſooner ending of your expectation, and that on this wiſe, *viz.* by a ſtronger Fire, which may make your Water boyl without any ceaſing, but yet in this ſame way of Operating there doth again happen this trouble, from that ſtrong and inceſſant ſcething, *viz.* that your Water being without any intermiſſion reſolved into Fume and Vapour, is always leſſened, and you muſt of neceſſity be always pouring in more new. Uſe which of theſe two ways you pleaſe, for you are e'en importunate and troubleſome enough unto me. I will not, for the time to come, take on me to inſtruct any more ſuch Diſciples as you are. What do you think, that if that ſhort work of three days, or of ſeven hours were known unto me, I would preſently reveal it unto you? No! But yet I am not gotten to ſo high a Degree of knowledge, as to profeſs my ſelf a Maſter of ſo great an Art. I do believe though, that ſuch things are poſſible to be done, but I deny, that I my ſelf am able to do ſuch notable things. And now, go home in God's Name, and diligently and ſeriouſly meditate upon all theſe things: You have heard enough, and my time will no longer permit me to confer with you. If perhaps, one or two Errours ſhould put a ſtop to your proceedings, you may again come unto me, and ask me thereabouts. Mean while I commend you unto God, and pray him to beſtow his Bleſſing upon your ſelf, and your Labours.

C. *Now am I contented, nor know what farther I ſhould ask: I am ſorry, that I have ſo much troubled you by my dull Brains, and beetle Head, and been ſo importunate: Nor know I, how to requite your deſerts; God will reward you with Life eternal, I ſhall go home full of joy, and bear a glad Meſſage, and Tidings unto my Family. And I pray God to be at all times preſent with us, to our Help and Succour.*

B. Amen.

The COROLLARY.

I Have, in this Third Dialogue, made mention of a certain ſecret fiery Water, which can ripen the Volatile and immature Minerals, and Metals: And herein I have principally regarded a *Particular* Tranſmutation. But foraſmuch as a *Particular* Melioration of the Metals requires as much time, and no fewer Expences, than the *Univerſal* it ſelf does, I would here commend to the Sons of Art the *Univerſal* work, which is to be preferred before a *Particular* one. Such things as we have perhaps omitted in this Dialogue, the Deſcription of my fourth ſecret Fire will ſufficiently ſupply the defect; to which, I refer the friendly Reader. He will there ſee and underſtand, that the greateſt part of the whole Work, and the very hinge of the ſaid Operation, conſiſts chiefly in the true Veſſel, in which our Matter is to be ripened; and without the knowledge of which, there can never be any thing done to purpoſe. Which Veſſel, ſeeing that all the Philoſophers have covered over, and hidden with ſo great a Care and Diligence, and have involved it with ſuch obſcure Clouds of darkneſs, I ſhould do amiſs, yea, moſt extreamly amiſs, ſhould I lay it open, and bring it from out of thoſe dark inwrapments, into the Light. Thus much only I ſay, that it ought to be ſuch a Fornace, and the Veſſel it ſelf ſuch a one too, as in which, all the Chymical Operations, *viz.* Solution, Putrefaction, Diſtillation, Sublimation, Cohobation, Aſcenſion, Deſcenſion, Circulation, Inceration, and Fixation may be perfectly ſhewn unto an *Hermetick* Diſciple, or Learner, in one hours time, in one little Fornace, in one Glaſs, and in one Fire, all which muſt not coſt more than

than the value of one quarter part of a Doller, and is all done without any changing of the Glaſſes, or putting to, of the hands of the Operator. Theſe are indeed ſuch things as exceed all the belief of the whole World, but yet they do not exceed *Glauber*'s faith, nor ſufficeth it him only to believe, but he can alſo effect the ſame, that ſo other incredulous people may believe likewiſe.

N. B. On a certain time, as I was familiarly diſcourſing with a learned Man, concerning ſuch great and incredible things, he preſented me with theſe following Verſes, aptly agreeing to this Matter in hand.

*Thy *Sirname* (Glauber!) *given was, as, unto* Faith, *relating* *John.
Yet by good right it ſhould have ſquar'd unto thy Operating.
Faith's Objects are inviſible, but yet, ſuch things, do you,
As would at firſt be ſcarce believ'd, produce by Art to view.

A Short Expoſition upon the Helliſh Goddeſs Proserpina, *the Wife of* Pluto, viz. *what the Heatheniſh Philoſophick Poets, as* Ovid *and* Virgil *underſtood by it.*

And how, by the help of this Proſerpina, *the* Animæ, *or Souls, of the Mortified* Metallick *Bodies are carried out of the Chymical Hell into the Philoſophick Heaven. Tranſlated out of the* High-Dutch.

READER, that we may ſee, if and how the inferiour Metals, by true Art, may be tranſmuted into good and conſtant Gold and Silver: I find, that it is firſt neceſſary to declare whence, and by what means the Melioration of the imperfect Metals muſt proceed by Art, and by what means only by Nature, without the hand of the Artiſt, the clean and fixed Gold and Silver hath arrived to ſuch a Purity, and Perfection.

It being then, that this knowledge is the only Foundation, upon which *Alchymy* is built, I find it neceſſary to diſcover it to thoſe, who are ignorant of it, and to ſhew a ſure way, in which they may go without hinderance, and happily arrive to the deſired End.

The Reaſon, why Nature generates all Metals in the Mountains, and brings ſome of them to Perfection, and leaves others imperfect, ſeveral Philoſophers of our Anceſtors have very plainly deſcribed, and therefore needs not here to be repeated. He that knows it not may enquire after it, in the Writings of theſe Philoſophers, where he may learn their Grounds, or Reaſons, only this little I think neceſſary here to ſhew, *viz.* that all Metals and Minerals have but one Original, or beginning, to wit, the four Elements, Fire, Air, Earth and Water. But that one Metal in the Earth, in which is its Matrix, becomes to be more noble than another, this is but accidental, according as one Metal by the Central Fire is more, or leſs cocted, and chiefly from thence, according as the Univerſal Spirit of the World, or firſt Matter of Metals, lights of a Matrix in the Earth, more clean or unclean. But paſſing this by, becauſe the Books of Philoſophers are filled with them, although obſerved by a very ſmall number of Men. For almoſt all who read Chymical Books, read only to the end, that they may ſee thoſe Proceſſes, which teach how to make Gold and Silver out of the inferiour Metals, but do not at all mind the Original, and difference of Metals, although that ought to be the firſt, for where the Philoſophers write of the Generation and difference of Metals, there they publiſh the whole Ground of *Alchymy*: But where they write their *Receipts*, and *Proceſſes*, their they obſcure the Art, and lead the eaſie Believers into Errour. Among all the Philoſophers, I have found none which hath dealt more plainly and openly in this Matter, than *Paracelſus* in his *Heaven of Philoſophers*, who writes, that every Metal is an hider or concealer of the other Six, or that every viſible Metal contains in it ſelf inviſibly and ſpiritually the other ſix Metals, and that to bring forth and make viſible, the inviſible, and more noble Metal, and on the contrary, to tranſplant the viſible and ignobler Metal in the ſame place, where the more noble and inviſible was, is very poſſible, which is indeed the very Truth. For I my ſelf have perform'd this Tranſplantation, not only once, but ſome hundred times. If any hath a mind to perform any notable thing in *Alchymy*, he can find no Book, which will teach him more than the Book above cited. But yet I will not deſpiſe the Books of other good Writers. And if this were not true, that every viſible Metal hides in it ſelf the others, inviſibly, how could it be poſſible to tranſmute any inferiour Metal, either univerſally or particularly, into good and conſtant Gold? But that it is poſſible, daily ocular inſpection proves to be true, in ſeveral places of the World. Now if this be ſo, as no man needs to doubt it, it will not be difficult to teach any underſtanding Man, if he will but learn a little how to handle the Fire, how to bring forth fixed and corporeal Gold, out of thoſe groſs and viſible Metals, in which lyes hidden a great deal of pure and ſpiritual Gold. But yet you muſt know, that one clean Metal hath more inviſible and ſpiritual Gold in it, than another. *Jupiter* hath in it much ſpiritual Gold, but *Venus* more, and *Mars* the moſt: Yet *Antimony* doth not give place to *Mars*, for the quantity of ſpiritual Gold. Now whoſoever is minded to undertake this ſort of Labour with Profit, let him take care what Metal he handles, and how he handles it, that inſtead of Profit, he may not reap diſcouragement and damage, but may have reaſon to thank God, Nature and Art; in which, this following Proceſs will ſufficiently help him, in which, the true and moſt

moſt certain way is openly ſhewn. Yet with this Proviſo, that he ſo lives, that God may be pleaſed with his Converſation, and not have it in Abomination. For Gods bleſſing is all in all. There muſt be together earneſt Prayers, diligent Conſideration, and unwearied Labour, or elſe one may eaſily fail, although the Art be plainly and clearly ſet before his Eyes, without any reſerve, which a good Chriſtan ought certainly to believe. Yet I have often heard the contrary, from impious Men, ſuch are the adherents and Conſorts of *Farnner*, as if God had nothing to do with ſuch Arts, and that Art alone was Maſter in theſe Caſes, which certainly is very impious, ſeeing that ſuch Blaſphemies, take away from God his Omnipotency, his Goodneſs and Mercy, and give them only to Nature, ſeeing that God hath not his beginning from Nature, but Nature from God. Have not the wiſe Heathens believed, that God could give his bleſſing to Mens endeavours, and take it away again at his Pleaſure? What ſaith *Virgil*, that famous Philoſopher? when he teacheth how to pluck the Golden branch from the *Opake* Tree:

Tene manu, facileque ſequetur, & uno avulſo,
Non deficit alter, ſi te fata vocant, aliter nullis viribus
Nec duro ferro avellere potes.

One Branch being pluck'd and born away,
Another follows; unleſs the Fates ſay nay:
Without whoſe Smile, no force of hardeſt Steel
To crop the ſmalleſt Twig, can ought prevail.

It is ſaid, *Ora & Labora*, Pray and Labour, according to which, let every Man live. Now you ſhall hear how the imperfect Metals, in a particular way, may be tranſmuted with great Profit, into perfect, and that very plainly without any reſerve, for I have obtain'd it at length by much Conſideration. And becauſe my great Age, and ſeveral long Sickneſſes keep me continually in Bed, and both Feet are as in the Grave, where I ſtand certainly expecting nothing elſe, but a happy departure out of this tranſitory Life, into a better, which paſſeth not away. So that I would by no means intermit to ſing with the *Swan* before my end, a pleaſant Song which may rejoyce all the Lovers of *Alchymy*, if they will make themſelves ſharers of this Melody. For thoſe who read what I here write, and yet give no Credit to it, nor put their hand to the Work, and finiſh it with diligence, they will reap no Profit by this my inſtruction. But thoſe who underſtand my Writing, and work plainly after the Letter, provided they have but a little underſtanding in the Fire, will reap great Profit; yea, even great Riches by it. For I am plain without any reſerve, ſo that if any ſhould fail, the fault will not be mine, but muſt be imputed to the Workmans want of Skil; for I never in my Life ſought to gain any thing by my Writing, neither will I now do it, but it ſufficeth me if I do good to my Neighbour, out of Love, with that Talent which God hath given me. Whoſoever is on *Glauber*'s ſide, and will participate of my good intention, he may, or let it alone, 'tis all one to me, for they are not all good Cooks that wear long Knives; the Art conſiſteth in Experience, and he that is but any thing skilled in Chymical Operations will do well enough, for all is laid plainly down before his Eyes. But on the contrary, the Covetous, Proud, and Lazy who ſeek to be rich without labour and pains, will find every thing dark, and never attain to any thing profitable. For God will have it ſo, that not every Body ſhall be Rich, as *Paracelſus* very well expreſſeth it in his Book of *Sulphur*, when he ſaith, *Many might be helped with a few Words, if it was not againſt the Will of God, for God will not have the* Goats-*tail equal the* Cows *in length, for elſe out of Pride he might with it beat out his own Eyes, and therefore it is better to be ſilent, that they may remain Poor.* Thus *Paracelſus*. But I *Glauber* ſay, that it is better to lay down the Art in truth, without difference before all Men, for God keeps ſtill his hand over it, and to whom he Wills it, he will give it, and to whom he will not give it, he knoweth how to caſt a Miſt before his Eyes, that he may not ſee the good, nor have power to apprehend it, but may wander about in darkneſs, with his proud and dull Head, till at length he fall into the Pit of the impious, and there periſh without help. But that I may no longer detain the Lover of Art with my Diſcourſes, but come at length to the Practice, I will in the Name of God here ſet down the whole Proceſs as it is in it ſelf, without any Reſervation, and the whole buſineſs is thus.

Now followeth the true, and often practiſed Proceſs, how to tranſmute Silver (as being yet not a perfectly mature Metal) by degrees, without any loſs, totally into the higheſt perfection, that is to ſay, into good Gold abiding all Tryals. After the revealing of this Proceſs, we ſhall alſo hear, how all the imperfect Metals, *viz.* ♄, ♃, ♂, and ♀ may after the ſame manner (but yet not totally, but only ſo far as they contain an incombuſtible *Mercury*,) be tranſmuted into good Gold and Silver. And after this Revelation, we will not omit to ſhew alſo, which way ☿ the moſt immature of all the Metals, may be tranſmuted, not only Particularly, but alſo Univerſally, into the higheſt Medicine, and the beſt Gold. But the later muſt thus be underſtood, that we may not caſt Pearl before Swine, but that they may remain only among honeſt hearts, and not come into the hands of double-minded Men.

But now, to come to the Melioration of Silver, the ingenious muſt know, that Silver is naturally fixed in the Earth, and endures the Fire, and therefore needs no Art to fix it; for it bears the Tryal of the Teſt, as well as Gold, wanting only Colour and Weight, which Nature hath not beſtowed upon it, but may be procured by Art. As for the Colour, the ſecret Fire of the Wiſe can only make it perfect, for all Colours are abſconded in the common Fire of Wood, and the Sun, as we daily ſee, that the Univerſally ripening Sun, brings all the Fruits of the Earth, from a Green and White, by its conſtant Beams, to Redneſs and Maturity. And we alſo ſee, that the common Fire, of Wood and Coals, makes Earths and Minerals which are White, become Red, as we ſee *Crocus Martis*, *Minium*, and other Colours which are produced out of Black, Gray, and White Metals and Minerals; as the highly illuminated *Paracelſus* hath ſufficiently taught us, *viz.* that the common Fire of Coals, by its own power and innate Nature, without any addition of other things, is perfectly able to graduate the white Metals, into Red, or yellow Gold, as you may ſee in his *Book of Cements*. If the common Wood-fire of it ſelf doth this, what cannot the Fire of the wiſe effect, which was always kept in the greateſt Secrecy? Eſpecially, if one know how to add a graduating *Metallick* Species, as *Mars*, *Venus*, and *Antimony*, and the like, after a ſpiritual manner, to the ſecret Fire; which is the way to give to white Silver, a conſtant Redneſs.

As

As for the weight of Silver, it may, in like manner as the Colour be given to Silver by Art, ſo that it ſhall be equal with Gold in weight: Which introduction of Colour and weight into ☽, the Philoſophers have called cloſing of its Pores. For this is certain, that if any light Metals are melted together, that one filleth up the Pores of the other, and both come out of the Fire more compact and heavy, than they were before. For example: Take half an Ounce of Red Copper, and as much of good Tin, melt theſe together, and pour them out into a Bullet-mould, and you will ſee, that they will not be much more in Magnitude than one of them was before; for one Bullet of ♀ and one of ♃ may almoſt be put into the ſame Mould: From whence it appears, that one Metal hath an ingreſs into the other, and mends, and augments it in its weight and Colour; but what thoſe Metals are which give weight and colour to Silver, you may eaſily gueſs. Nothing can tinge, but what is naturally Coloured, and nothing can better give weight, than what is naturally heavy: In which, ♀ and ♄ have the Prehemineny, but in introducing Colour, *Mars*, *Venus*, and *Antimony* excel. But which way this introduction of colour and weight, into light and white Silver, is to be done, the following Proceſs will teach.

But this the Ingenious ought to know, that it is no Art at all, that if the Iron made Red, and ♀ and ♄ made White, be mixed with ☽, yet they will not render it durable, red and heavy: But the Corroding ♄ will quite take away the Redneſs and Whiteneſs upon the *Cupel*: For what is not purged from all combuſtible *Sulphur*, connot ſuſtain the *Cupel*, but will vaniſh with *Saturn*, and turn into *Scoriæ*: And ſeeing that we know, that ♂ and ☿ contain abundance of ſuperfluous combuſtible *Sulphur*, and alſo that their incombuſtible *Sulphur* is not yet fixed enough, to reſiſt the Corroding ♄ upon the *Cupel*, and therefore with him muſt vaniſh and come to nothing, for all that is able to abide the *Cupel* muſt be ſeparated from all combuſtible *Sulphur*. Now we know, that ♂ and ☿ are not ſo, and therefore cannot abide the *Cupel*. For ♂ if he be made Red, and caſt upon Silver, he doth not remain Red with it, but ſo much as enters the Silver, again becomes black Iron, and therefore can give no Colour to the Silver; and alſo ☿ flies away, and ſo leaves no weight to the Silver: Which *Paracelſus* hath ſufficiently deſcribed in his *Cœlum Philoſophorum*. So that if one melt unfixed Metals with Gold and Silver, and keep them together never ſo long in the Fire, yet notwithſtanding the unfixed Metals, cannot be made fixed by the Gold and Silver, but every of them would again be found in the *Examen*, as they were before. But if one Metal ſhould make the other better, they ought to be ſpiritually conjoyned, and ſo the Spirit of one Metal will improve the other. For all Philoſophers teſtifie, that the Metals muſt firſt be reduced to their firſt Matter, that is, they muſt be brought into a ſpiritual being, before they can be tranſmuted into more Noble, by Art. But which way all Metals are to be ſpiritualized, and brought to their firſt Matter, is taught in my Treatiſe of the *Three Principles of Metals*, lately publiſhed, as alſo in the Seventh part of my *Pharmacopæa Spagyrica*, and its Appendix. Now if one would Meliorate, or improve, the imperfect Metals, the imperfect combuſtible *Sulphur* muſt firſt be ſeparated from them, that only the pureſt and incombuſtible part, *viz.* the incombuſtible *Sulphur* may remain; which may be done by ſeveral ways; as by Diſtillation, and Rectification, and alſo by Aduſtion, and Combuſtion, in which nothing periſheth, but the combuſtible and unprofitable part: But the incombuſtible Oyl ſtill remains, and doth not periſh by the Fire; and alſo by Solutions, Diſtillations and Rectifications, all the unprofitable Feces of the Metals are ſeparated, and there remains only the clean Quinteſſence of the Metals, which are ſeparated and advanced into a concentrated Medicine. This Separation of the unprofitable and combuſtible *Sulphur*, from the incombuſtible, an Old Philoſopher hath notably expreſſed in theſe Verſes.

Eſt impoſſibile, Sulphur ſine Flamma delere,
Calcis aduſtibile, quod præſtat foſſa Mineræ.

Sulphur *impure, we can't blot out,*
Till Circling Flames play round about
Our Oars and Calces; for then they
This ſubtil Fire forthwith obey.

Here the Philoſopher tells us, that every combuſtible *Sulphur*, may be burnt, and reduced into nothing, but no otherwiſe, than by a kindled and combuſtible Fire, by whoſe Flame nothing that is good, but only the ſuperfluous and noxious *Sulphur* by which all the inferiour Metals are deſtroyed, is taken away. And therefore juſtly reputed imperfect, as long, and as often, until this unprofitable *Sulphur* is taken away from them, either Particularly, by Diſſolving and Coagulating, Diſtilling and Rectifing, or elſe by an Univerſal fixed *Mercury* by projection, by which means the hurtful combuſtible *Sulphur* is fixed, and, without Combuſtion, tranſmuted into a nobler Metal. For this is very poſſible, that any combuſtible *Sulphur*, by an eaſie way and ſmall Charge, and in a ſhort time, *viz.* in one day, Particularly, may be ſo fixed, and made conſtant in the Fire, that, without being burnt, it may be able to endure the ſtrongeſt Fire, the which is handled more at large, in my *Three Principles of Metals*. From hence it follows, that no imperfect Metal can be tranſmuted, with Profit, into a Perfect, before it be free'd from its combuſtible *Sulphur*, which may be done ſeveral ways. Now, he who hath a mind to get any good out of the imperfect Metals, muſt learn how to ſeparate their unprofitable *Sulphur*, either by one means or other, as I have ſufficiently taught. For in this, *viz.* in the Separation of the combuſtible *Sulphur*, from the incombuſtible, conſiſts the whole Art; which every one ought to attend without other thoughts. Now after we have underſtood out of this Theory, in what the Melioration of the Metals conſiſts, or how it muſt be effected, it is neceſſary to know the exact Practice, or Proceſs, as the Operations ſucceed one another: For to this work belongs, not only Diſtillation and Rectification, to ſeparate the pure from the impure, but alſo the moſt ſubtil and clean parts, after they are ſeparated from their Feces, muſt be made fixed, ſubtiler, and conſtant, *viz.* ſo conſtant, that the Corroding ♄, may not overcome them, but againſt his Will, leave them conſtant upon the *Cupel*. This is one of the greateſt Secrets in *Alchymy*, yet taken notice of but by few, and therefore few there are who reap any Profit. For the greateſt part of Operators are perſuaded, that if they had but Red Metallick Tinctures, that they could immediately tinge with them, but in the end they have underſtood, that more than unfixed Tinctures are required. It is an eaſie Matter, to make Red Tinctures out of Stones and Metals: But theſe are not permanent on the *Cupel*, without true Fixation, which the Philoſophers call Perpetuation in the Fire. Nothing in the

World can tinge, so that the tinged Metal can endure the *Cupel*, as long as the Tincture is still Metallick. For whatsoever is made out of Metals, and by a strong Fire may again be reduced into a Metal, cannot be called a true Tincture, for whatsoever yet contains a combustible *Sulphur*, perisheth upon the *Cupel* with *Saturn*, and nothing abides, but what is totally deprived of that. For even the *Saturn* contains much combustible *Sulphur*, therefore he so readily acts upon Sulphureous Metals, and draws them with himself into the *Cupel*, which he cannot do to Gold and Silver. But because we also know this, that when by the help of common fixed Gold, a combustible and fugacious *Sulphur* is well united and fixed, that the combustible *Sulphur* adheres so closely to the fixed Gold, that it also remains fixed with it, and can never be separated from it. Now, if the weight and proportion be well adjusted, then the fixed *Sulphur* enters with the Gold into Lune, and Tingeth it into constant Gold. But if the conjunction of the *Sulphur* and Gold, be not well made, or too much of the *Sulphur* be put to the Gold, it takes away the Ingress of the Gold, so that it remains with the *Saturn*, and cannot enter the Silver. It is also to be observed, that if the *Sulphur* of ♂, ♀ or ☿ be legitimately united with ☉, and yet be not kept long enough together, it will produce no good; and therefore the Transmutation of Metals is not so easie a thing, as many imagine; it is not enough to make a Tincture; to fix it, is more; and to give an Ingress, is hardest of all. And these three things ought to be well known, if one would effect any good in the Transmutation of Metals.

Now that we may farther hear, which way Tinctures may be drawn out of the Red Metals, fixed, and made constant in the Fire, and how to give them an Ingress, I have undertaken to Reveal to the Lovers of Art. And none needs to doubt, but what I here Write are my own Inventions, which I have not only once or twice, but many times experimented, and always found good, although in small quantities, provided no accident hath hindered me. If a Glass break in the labour, or a Crucible runs out, by which one suffers loss, that is not to be accounted a loss, because it comes by accident and not from the Art, and therefore not to be imputed to the Art. If an Art be never so well described, and an Unskilful Workman intermeddle with it, the Work may be easily spoiled, and therefore the fault cannot justly be charged upon the Art, as it is too often done. I shall here acquit my self of this unjust charge, if out of a good Intention I here discover the Art, as I have often done, without concealing any Manual Operation, and hereafter shall not care what Ill Men say or judge of it, if any one, through his want of Skill, should lose his labour. I here Write nothing, but what I have often done my self, and found good; for what should move me to publish any false thing, that might seduce others to labour in vain, even when I am ready to dye? I never sought any Profit by any of my Writings, no, not when I was young, and might have occasion for it. And now, when both my Feet are in a manner in the Grave, and I am certain not to live much longer, although I am heart-whole, nor find I any dolour about me, yet my Limbs being weak, I am forced to keep in my Bed, where I Write this. I say, Why should I, so near my end, write any thing hurtful to my Soul? I write this for my farewel, to do good to the World, even as the Swan, when she is near her death, sings a pleasant Song, and such I would that every one should take these my last Writings to be. But if it shall please God, I hope this will not be the last; which is only a small Work, to shew the probability and verity of the Transmutation of Metals, and to help Skilful Chymists to great Riches. But if God shall yet spare my Life, I shall write of higher matters, and shew such a light to the blind World, as hath not yet been revealed by any Man. In the mean time, I desire the Ingenious very well to consider this particular, and to try his Fortune, every thing is easie to be done, and needs no beating of the Brain, for all the labour is clearly laid down, without any reserve, therefore I would have none be so arrogant, as to impute the fault to me, if he miss his Intention, but rather to himself, through his own unskilfulness or negligence. Yet this is also to be considered, That sometimes a true skilful and diligent Operator cannot imitate an easie thing, being hindered by the Almighty, who for certain Reasons keeps his Hand over it, and will not let every Man grow Rich.

Now follows the Fundamental Process, how to make good Gold out of Silver, with profit, and how to separate, after a particular manner, good Gold and Silver, out of Iron, Copper, Tin and Lead.

℞. A pound of Steel Wier, more or less, according as you will begin your Work in a greater or lesser quantity, dissolve it in Spirit of Salt, filter the Dissolution, and abstract the Phlegm from the Solution, in Sand, for in the Abstraction there will come over no acidity, (because the *Mars* holds it after a Magnetick manner) but yet this is not without virtue, for it carries over with it self a very subtle Martial Spirit, of which a little put into ones Mouth, penetrates the Tongue, so that the taste thereof remains long after. And this penetrating taste and smell, is nothing else but the most subtle Narcotick *Sulphur* of *Mars*, which is set at liberty in the Solution, and carried over with the sweet Water, in the deflegming. It doth wonders in Internal Obstructions; and Externally it easeth all Pains, because it is Narcotick and Stupefactive; It serveth for Physicians and Chyrurgeons in many cases, but because I have already written of this, I need not here repeat it. And this you ought to note, that you draw not off the Phlegm to dryness, but the Solution of ♂ must remain in form of an Oyl. This sweet Oyl of ♂ is the *Opake Tree of Virgil*, from which he hath taught us to pluck its Golden Branches, and how this is to be done, he hath also obscurely hinted, but I here publish it plainly. *Virgil* saith, that those Golden Branches are the gift of *Proserpina*, but what was to be understood by this *Proserpina*, which the Heathens have said to be the Wife of *Pluto*, is not here expressed, but only this, that this Golden Branch was Consecrated to the Goddess *Juno*. He that will have the foundation of those Heathenish Gods, cannot better accomplish his Desire, than by Reading the last Edition of the Dictionary of Eight Languages, written by *Ambrosius Callepine*, for there he will find many curious secrets of the Ancient Poets illustrated. Now concerning *Proserpina*, many Philosophers and Chymists understand the Corrosive Oyl or Butter of *Antimony*, of which I have already made mention, although obscurely, in my Treatise *De Sale Philosophorum*, but shall here give it you more plainly. Now, if according to a due weight, you put some of this *Proserpina* to the Solution of *Mars*, and unite them well together, and then distil this mixture by a Glass Retort well Coated, there first comes over a certain unprofitable Humidity, then a white Oyl of *Antimony*, which

is

is to be kept by it ſelf, and when you ſee yellow drops begin to fall, you muſt then change your Receiver, then give a ſtronger Fire, and the *Proſerpina* brings over with it ſelf the Tincture of *Mars*, as red as Blood. This Blood-red Oyl of *Mars* and *Antimony* is the Golden Branch, plucked from the obſcure Tree, which may eaſily be fixed into a particular Tincture, as we ſhall hear anon. Now when you have pulled one Golden Branch, you may alſo pluck a ſecond and third, for they will eaſily follow. As for the manner of plucking more ſuch Golden Branches, it is thus: You muſt diſſolve the remaining ♂ with Spirit of Salt, and there will remain many Feces, but the Solution will be clearer and better than the firſt, although leſs in quantity: Now, after (as I told you before) you have put to it the due quantity of Butter of *Antimony*, for which purpoſe that which came over in the firſt Diſtillation will well ſerve, and when you have driven this over by a Retort as before, the *Proſerpina* again brings over more of the Tincture in a Blood-red Oyl, which may as the firſt, be fixed into a Tincture. After this manner you may pluck many Branches, one after another, but it is not convenient, becauſe the Solution of *Mars* is diminiſhed by every Diſtillation, and at length your Branches would be very ſmall; therefore it is better when you have plucked the firſt Branch, to go to another Tree, and there to pluck a Golden Branch, for the Tree is not ſo precious, and you may collect the Trees from which you have pulled the Branches, and diſſolve them in Spirit of Salt, and then pluck from them more Branches. *Proſerpina* hath learned this ſpoiling and bearing away, of her Huſband *Pluto*, for he ſtole *Proſerpina* from her Parents, and carried her with him into Hell, and made her his Wife. *N. B. Pluto* carried *Proſerpina* into Hell, but *Proſerpina* doth the contrary, carrying the dead Bodies and Souls out of Hell. For ſhe hath her Original only from the Spirit and Salt of the World, which Spirit and Salt of the World have power to carry the Souls of the dead Bodies out of Hell, as you may ſee in the Books of Philoſophers which ſay.

Sal & Spiritus Mundi, ducunt Anima Mortuorum ex Orco.

The Salt and Spirit of the World, bring the Souls of the Dead out of Hell.

Let this ſuffice concerning the bringing over the Metallick Souls or Tinctures, which is done by *Proſerpina*. But there is yet other ways to draw out the Tinctures of Metals out of Red Bodies, and they are chiefly to be had by means of our ſecret *Sal Armoniack* in a far greater quantity, than by the help of *Proſerpina*, which is ſomewhat troubleſome, but yet theſe are more eaſily and perfectly acquired by our Alcaheſt. Now, after we have heard how to draw Tinctures out of Metals and Minerals by the help of *Proſerpina*, it is further neceſſary to know how to fix thoſe Volatile Tinctures, ſo that they may not only endure the ſtrongeſt Fire, to which they may eaſily be brought, but that is not enough, they muſt be made ſo fixed, that the Corroding *Saturn* may not have power to injure them upon the *Cupel*; if that be not done, theſe Tinctures can profit nothing to Metals. I have ſeen very many who very well know, how to Extract Tinctures out of *Mars*, *Venus*, *Vitriol* and *Antimony*, but they wanted the Fixation, the perpetuation upon the *Cupel*, and alſo Ingreſs, and therefore they could do nothing with them. Theſe following ancient Verſes are read by many, but underſtood by few, *viz.*

Fixum ſi ſolves, faciesque volare ſolutum
& volucrem figes, faciet te vivere tutum.

If thou diſſolve that which is fixed, and render it Volatile,
And again fix the Volatile, thou ſhalt not want.

We have proceeded according to this Verſe, in making the fixed Iron Volatile, although we have not yet again rendered the Volatile fixed and conſtant upon the *Cupel*. The Fixation requires but little Art, ſo that it may abide the Fire, but to make it abide the *Cupel* is a great Art, and cannot be done by idle talking, but by a fundamental knowledge, without which all is in vain.

Now concerning the Fixation of thoſe Volatile Tinctures, ſo as to abide the *Cupel*, I have (thanks to God) often experimented, and have already communicated to ſome who are Curious, out of kindneſs, whoſe ſucceſs I do not yet know. This Fixation cannot be effected without Common Gold, for when Gold in a liquid form according to a due proportion, is mixed and radically conjoyned with the Tincture, and caſt into Hell to *Pluto*, and *Pluto* finds his dear Conſort deeply in love with the *Anima* of *Mars*, or this Beautiful *Hermaphroditical* Youth, he burns with Jealouſie, ſo that he bends them ſo cloſe together, as they can never afterwards be parted by *Saturn*. But whereſoever one of theſe three goeth, draweth the other two with it. And becauſe they are alſo conſtantly together, as if it were one Spirit and Tincture united to the fixed Body of Gold, therefore they have an eaſie admittance into the Chamber of the Queen *Diana*; for *Diana* doth by no means ſhut out her deareſt King *Apollo*, but willingly admits him, and therefore ſhe is recompenſed with all the Treaſures which he hath received from his true and Warlike Servant, *Mars*: And of this, by *Neptunes* help, ſhe hath made her ſelf a glorious and conſtant Red Garment, which neither Water nor Fire, nor the old and envious *Saturn* can ſpoil her of. Here I have Fundamentally deſcribed the Fixation of the Martial and Antimonial Tincture, clearly without any reſervation, yet ſomewhat enigmatically, according to the manner of the Poets. He that doth but a little conſider, cannot fail, but muſt comprehend it, if he hath but a moderate Capacity, except God ſhall prohibite him.

Now let us further ſee, what may be further done with our Red Oyl of ♂, and ☿, in Phyſick and Alchymy. When we powr upon this Oyl our *Alcaheſt*, and again draw off the Liquor by a Retort with a gentle heat, and at length give a ſtronger Fire, the moſt ſubtle and cleaneſt part of the Tincture will come over, and the groſſeſt part will remain behind, which is an Univerſal Purge. The ſubtle part, may yet be made purer and nobler by Rectification, and this you may afterwards dulcify from its Salt, and dry the *Anima Martis* and *Antimonij*, then put it into a Glaſs, and with an eaſie Sand-Fire melt it into a Red Stone, for this Stone melts as eaſily as Wax, and hath as eaſie Ingreſs into all Metals, as Oyl hath into dry Leather. This Stone hath not its equal, for it is better than the Fire-Stone of *Baſilius*, it is better than *Butlers* Stone, to which *Helmont* hath aſcribed ſuch Wonders. Of this Stone and its incredible Virtues, which it ſhews in Phyſick, I ſhall treat at large in the following Treatiſe. This Treatiſe ſhall Diſcourſe of three

three unknown Fires, and Stones: Frſt of the ſecret Fire of the ancient Philoſophers, which is called the *Fire of Artephius*, by Virtue of which ſecret Fire, is generated the vegetable, Animal and Mineral ſtone of Philoſophers, and alſo particularly out of all Vegetables, Animals, and Minerals, their Quinteſſence, or higheſt Power, without the help of any common Fire, without Furnace, Glaſſes, or any other known Chymical Inſtruments, is to be obtained in a few hours, without any Labour or Coſt: And alſo things incredible and unheard of are by it brought to paſs; of which great Secret, no Philoſopher hath hitherto made the leaſt mention; as the before cited Treatiſe will ſufficiently teſtifie. The ſecond Fire is like to it, *viz.* the ſame with which the *Iſraelites* in old time did ſet Fire to their Sacrifices, which their Prieſts, when they were to go into the *Babyloniſh* Captivity, did hide in a dry hole in the Earth; and many years after, when they were releaſed from their Captivity, and returned, they found not a Fire, but inſtead of it a *Viſcous* water, which they poured upon their Sacrifice, and it kindled it, as well as if it had been done by the ſecret heavenly Fire, of which you may read more in the *Maccabeus*. This ſecret Fire of the Ancient *Caldeans* is alſo comparable to the *Æthereal* Fire, of which Meteors, Thunder and Lightning are generated, and alſo the Thunderbolts themſelves, which are caſt down upon the Earth, to the great aſtoniſhment of Mankind. *Hermes* hath very well ſaid, that what is above is alſo below, which is proved by the ſecret Fire of the *Caldeans*. For by a light, plain and cheap Art, one may eaſily produce the ſame Lightning fire, together with the Thunder, here upon Earth; of which the following Book ſhall treat more fully. And therefore to that I refer the Reader. I could not but here touch a little at theſe three Principal Fires, by which are generated the three chief Jewels of the World, that the Enquirer after the Wiſdom of God may know, what great Myſteries of God are to be imparted hereafter to the ungrateful World, before I publiſh this Book of Fires and Stones. Now to return to our particular, and ſee by what means our Red Oyl of *Mars* and *Antimony* may be Coagulated, after a nearer way, into a tinging Stone, with which Silver particularly, with all other inferiour Metals, may be Meliorated, that out of them may be had good Gold and Silver with profit. And alſo, how by it the Tinctures of Stones, both noble and ignoble, may be drawn out of them, and after the Tincture is drawn out, to incorporate it with Silver, and Colour it. And alſo, all precious Stones exalted in their natural Colour, and if their Colour be too high, it may be diminiſhed, and the Stone rendred more precious, and how this is to be done, the following Practice will reveal. The ſecond and eaſier way, how to bring our tinging Red Oyl of *Mars* and *Antimony* into an hard, ſweet, and not Corroſive Stone, is this.

In the foregoing Appendix, I have ſaid ſomewhat of the Coagulation of the ſharp Spirits, of Metals and Minerals, and have proved, that ſuch Coagulation is to be made by the help of Old, cold and dry *Saturn*, but becauſe I did not there declare, how it is to be effected, I think fit to do it here, and it is thus. All Liquors or moiſt things, if they are to be dryed, then the moiſture muſt be drawn off from the thicker part by an eaſie heat, and then the thicker part remains by it ſelf, and is uſed according to its Appropriation, as we know, that *Aloes*, *Myrrh*, *Opium*, and all other Gums and Juices were thin at the firſt, and were inſpiſſated into concrete Juices, by the Sun or Fire. It is true, ſuch an Inſpiſſation of vegetable Juices is eaſily done in this manner; but Mineral diſtilled Spirits, and Corroſive Oyls, cannot be thus dryed, for they will endure heat, but if you give too great a heat, they will fly away and not be thickned, as you may ſee in Oyl of *Vitriol*, which by it ſelf can never be dryed, although it be never ſo long kept in heat. But if you will have it dry, you muſt add ſomething to it which is more than dry, and hath alſo power to exſiccate moiſture. We ſee in the baking of Bread, when we put water to the Flour, and mix them together to make Dough, and of that bake Bread, that the Flour, although it be dry, yet it cannot retain with it ſelf the Water, in a hot Oven, for that perfectly flies away from the Meal by the heat, and if the Fire be encreaſed, all the moiſture would be gone, and only the Meal remain in form of a dry Earth, having quite loſt the form of Bread, becauſe the Meal was not radically united with the water, and therefore they could not endure the heat together. If one take a dry Earth, Sand or Powder of a Stone, and put water to it, the dry Earth will imbibe the water, and to the Eye reduce it into Earth, but this is not conſtant. For if you diſtil this Earth by a Retort, all the added water will again come over, and leave the Earth alone, but this is to be underſtood of common water. But ſuppoſe, one ſhould add a heavy Mineral water as *ol. Vitrioli* to a dry Earth, and ſhould commit this mixture to the Fire, in hopes, that the dry Earth ſhould retain with it ſelf the Corroſive Oyl of *Vitriol*, and alſo reduce it into a dry Earth, it would prove a miſtake, for the Oyl of *Vitriol*, in a ſufficient heat, would wholly forſake the Earth, becauſe the Earth is dead, and hath no Sympathetick, or Magnetick power, to conjoyn it ſelf radically with the Oyl of *Vitriol*, ſo as to remain together conſtant in the Fire; but ſuch an Earth, which by an innate Love draws the Oyl of *Vitriol* to it ſelf, and endures with it in heat, or cold without Separation, muſt proceed from the ſame Original with it, for every thing loves its like, and hateth what is unlike to it. Now, becauſe the Oyl of *Vitriol* proceeds from a Mineral kind, therefore it loves the Metals, but no common Earth or Stones, for it hath no affinity with them. Now if the Oyl of *Vitriol* be to be converted into an hard Mineral ſtone, it muſt be done by its like, to wit, by Metals, and by ſuch Metals as are moſt nearly related to it, *viz.* the Metals that are yet imperfect, for all Metals and Minerals proceed from the ſame Root, and therefore they all love one another, yet one Metal loves Oyl of *Vitriol* more than another, and the immature Metals, better than the ripe ones. For although Gold and Silver alſo love Oyl of *Vitriol*, yet they do it by Compulſion, and not out of true Love, for they are very difficultly diſſolv'd by it, becauſe they have put off their vitriolick Nature in their Fixation: On the contrary, *Mars* and *Venus* have not yet ſo done, and therefore they eaſily aſſume the Oyl of *Vitriol*, and are diſſolved by it, becauſe it was driven out of their Body by the force of Fire, therefore one might ſay, that *Mars* and *Venus* were the true Metals, and eaſieſt to Coagulate the Oyl of *Vitriol* and *Antimony*, and to fix them into a Stone, yet this is not ſo, for *Mars* and *Venus* are of a groſs Nature, and have too much unprofitable Earth, which may eaſily be ſeen by their difficult melting in the Fire. Then what is to be done? Shall *Saturn* or *Jupiter* do it, both which are of an eaſie Fuſion? Or, ſhall *Mercury* do it, which is always Liquid? I anſwer, that *Mercury* cannot Coagulate, nor

make

make fixed, becauſe he himſelf is not fixed, nor Coagulated. Neither can *Jupiter* do it, for although he is fluxible and dry, yet he is eaſily tranſmutable by a ſmall Fire, into an influxible Earth, which cannot again be reduced into a fluxible *Metallick* Body: What then, ſhall deſpiſed *Saturn* do it, (may one ask) who is unfixed himſelf? and which way is it then poſſible for him to fix a Body, which is more fluid than himſelf? To this I anſwer, that the Fixity is not the only cauſe of the Coagulation of the Oyl of *Vitriol*, for then this Coagulation might be eaſieſt performed, by Gold and Silver, which, yet is not done, and therefore this Coagulation of Corroſive Spirits muſt be done by dry *Metallick* Subjects. Now we know very well, that among all the Metals *Saturn* is the drieſt; of which *Paracelſus* writes very well in his Book of Vexations, which I have already alledged, and confirmed in the foregoing Appendix, [viz *Pharmacopæa Spagyr. Pars* 7.] It is alſo true, that a better Coagulator, of all Corroſive Mineral Spirits cannot be found, than old, cold, and dry *Saturn*; for by his great dryneſs he Coagulateth the moiſt Mineral Spirits; by his great innate ſweetneſs, he dulcifies all Corroſives; and by his fluxible *Sulphur*, he renders all influxible *Metallick* Subjects, fluxible. Now we need nothing more to our Red Oyl of *Vitriol*, *Mars* and *Antimony*, but that it be Coagulated into a hard, ſweet and fuſile Stone, which Coagulation can only be done by *Saturn*, and by no other Metal or Mineral, which I have ſufficiently proved in the before mention'd Appendix, and alſo in my Book of the *Three Principles of Metals*. Now we have ſufficiently underſtood, that the Coagulation and Dulcification of our Red Corroſive Oyl of ♂ and ♄ into a fuſile Red Stone, can only be done by the help of the Old, Cold, and, of all Fools, deſpiſed *Saturn*. Concerning the Nature and Property of *Saturn*, it would not be here amiſs, to ſay ſomewhat of it: But becauſe *Paracelſus* hath already ſufficiently done it, in his *Cælum Philoſophorum*, and I have already confirmed it in the forementioned Appendix, I think it here unceceſſary to add any more. Yet I cannot forbear to ſay this, that *Saturn* naturally contains yet a good quantity of the Corroſive Oyl of *Vitriol*, which doth not vaniſh in melting, nor cannot be eaſier perceived, than when other Metals are added to him upon the *Cupel*, how ſoon he ſwallows them, and draws them with himſelf into the *Cupel*, except Gold and Silver, which he cannot touch, becauſe they have no radical Communion with him, but are cleanſed by Nature from their ſuperfluous *Sulphur*, for this devouring Wolf *Saturn*, can conſume nothing, but the combuſtible *Sulphur* of Metals, but the incombuſtible fixed *Sulphur* and *Mercury*, he cannot touch, as appears in Gold and Silver. The ancient Philoſophers painted *Saturn*, as an Old Man, with one foot on a Wooden ſtilt, having in one hand a Sythe or Sickle, and in his other hand a Child, which he puts to his mouth to devour it. By this they would intimate the devouring Nature of *Saturn*, which they have alſo expreſſed in theſe Words, *Falx ejus Mordax eſt*, he hath a ſharp Sickle, beware of him, for he hath no mercy, which I have found to be true, not only by the *Cupel*, that he Corrodes and eats through them, for he Corrodes Sand and Stones, and reduceth them into a tranſparent Glaſs; if he doth this by his own Nature, what will he not do, when his Sythe is whetted by the Corroſive Oyl of *Vitriol*? Certainly he can do ten times more: I have experimented it, he that will know it, may alſo do the ſame: By him we waſh and cleanſe common Gold and Silver on the *Cupel*, but that Gold and Silver, which is ſtill hid in the imperfect Metals, as *Mars*, *Venus*, and *Jupiter*, as alſo in the vile Minerals and Stones, which is ſtill cloſely tyed to the combuſtible *Sulphur*, here the common *Saturn* is too weak and can make no Separation. On the contrary, ours can effect it very well, and therefore I commend him, for after his Sythe is whetted by the Corroſive Oyl of *Vitriol*, if then one handle any Metal, or Mineral with him in a Crucible, he will in a moment eat a hole through it, and run out; Nay, if one ſhould put two or three Crucibles one into another, he would do the ſame, but if one caſt ſomewhat before him, to ſatiate his Wolf-like Appetite, then he leaves the Crucibles whole, but doth what the Artiſt would have him, and is uſed as a tame Wolf, devours the Sheep no more, but keeps them from other devouring Wolves.

Before I could bring him to that paſs, to prevent his biting, I tryed many ſorts of Veſſels to hold him, nay I have put him upon a Teſt made of bone Aſhes. 'Tis true, he did not eat in, but remained fixt upon the *Cupel* like Silver, and would not Coppel, by which I perceived, that any common Lead, by help of the Red Oyl of *Mars* and *Antimony*, may in a very ſhort time, not only be reduced into Gold and Silver, but alſo be fixed into a true Tincture, which I have ſufficiently ſhewn in the foregoing Appendix, that ſome of the ancient Philoſophers have made their tinging Stone out of *Saturn*. But ſetting this aſide, becauſe I yet never went ſo far, but I ſhould not think it at all difficult, to make an univerſal Tincture, to tranſmute all the Metals into perfect Gold and Silver out of *Saturn*, with the Red Oyl of ♂ and ♄, if my weakneſs of Body would permit. But I concern not my ſelf about that, but leave it to thoſe that are younger, for I can eaſier come to an univerſal Tincture, by the help of the ſecret Fire of Philophers, than by *Saturn*; but in the particular Tranſmutation of Metals, I have performed many things with the Stone of ♄, as the following Practice ſheweth.

Now followeth the eaſie Coagulation of our Red Oyl of Mars *and* Antimony, *into a Red, Sweet, and fluxible Stone.*

℞. Some Pounds of common Lead, melt it, and pour it out into a long Ingot, and raſp as much thereof as need ſhall require; take of this a Pound or more, and put it into a Glaſs Retort well coated, pour to it half the quantity of the Red Oyl of ♂ and ♄, ſet it in a Sand *Cupel*, and give Fire gently by degrees, and there will come over no Red Oyl, but only a clear and inſipid Water, and all the ſharpneſs, with the Red Tincture, will remain with the ♄. If you break the Retort, you will find no *Saturn*, but this Red, Tinging, and eaſie melting Stone, of ſuch Virtues as I have told you before. Now if you will make uſe of this Stone for the particular Meliorating of the inferiour Metals, as alſo for noble and ignoble Stones, you muſt powder it, and mix it with the *Metallick* Aſhes, and melt them, and you will find the good Metal to be ſeparated from the reſt, the unprofitable part, and ſuperfluous *Sulphur*, will turn into droſs, and the purer part will ſettle into a *Regulus*, which you muſt blow off upon a Cupple, and you will find the Silver and Gold, which our Stone hath ſeparated out of that Metal; for our Stone hath this Nature, to ſeparate in the Fire the good from the bad, to turn the Good into a Metalline *Regulus*, and the inferiour into Droſs. For Example, I have a mix-

ture of Metals containing Gold, Silver, *Venus*, *Mars* and *Jupiter* together, I granulate this mixture, and mix them with our Stone, melt them together in a Crucible, our Stone only ſpoils the inferiour Metals, as ♂, ♀ and ♃, which it conſumes into a Droſs, but the purer as ☉ and ☽ it ſeparates from this Droſs, and precipitates them into a *Regulus*. But if this *Regulus* ſhould not be fine enough at the firſt melting, you muſt *Cupel* it with Lead, neither doth all the ☉ and ☽ come out of this mixture at one melting, but ſome remains with the Droſs, therefore you muſt again put this into a Crucible, and put to it ſome filings of Iron, and ſo melt them together, then the wild *Sulphur* will be deſtroy'd by the ♂, and ſo let the Gold and Silver fall by Cupellation. The Droſs you muſt reſerve, till you have enough to melt in a ſmall Wind Furnace, and it will be again reduced into Lead, which you may again uſe for the ſame Labour; for the Reduction of this, I have invented a peculiar ſmall Furnace, which may be carried from place to place, and alſo you may pour out the Droſs after it is melted, without breaking any thing of the Furnace, ſo that you may uſe it very often, before the Hearth will need mending. What is here ſaid of the Separating of *Metallick* mixtures, the ſame may alſo be underſtood of thoſe Mixtures, which are yet in the Oar, for the Oars are as eaſily ſeparated by our Stone, as the Metals. This is the uſe of our Stone, before its Tincture is yet fixed, and therefore not able to tranſmute ☽ into ☉. Preſently you ſhall alſo hear, how it may be rendred capable to tranſmute any Silver, by Degrees, into good Gold. I think it fit, firſt to ſay ſomewhat, how by the help of our Stone one may attain great Profit from Gems. For the Gems have in them fixed Tinctures, which our *Neptune* can ſpoil them off, and ſo incorporate them with the naked *Diana*, to make her a Golden Veſt, which is done thus: ℞ The fragments of coloured Gems, *viz.* of Granates, Rubies, Saphirs, Hyacinths, Jaſpis, *&c.* put a little of theſe into a good Crucible, and put to it three times as much of our Stone, cover it well, and melt it upon thoſe Stones, and our Stone draws out the Colour of the Gems, and Colours it ſelf yet deeper. With this Red Stone, if any filed ☽ be mixed with it, and melted, it draws the fixed Tincture to it and becomes Golden, ſo that in the Separation it yeilds much Gold, *N. B.* The fitteſt Silver for this work is, that which is precipitated by ♀ out of *Aqua Fortis*, yet you may alſo uſe that, which is precipitated by Salt-water. If the work be well done, the Gems will be white, which you may uſe inſtead of ſmall Diamonds, for the Fire doth not take away their hardneſs, *N. B.* If a Man hath Skill enough to take away the Colour from the great Gems, as Granates, and Hyacinths, he may acquire Riches in a ſhort time; for afterwards you may tinge other white Stones into Rubies, by the help of this Colour, but this Labour requires an experienced Artiſt, but no Pratler: And this is ſufficient for this time, he that delighteth in theſe Arts may Practiſe them, and try how God will proſper him in it. If he can but obtain the Extraction of the Gems, he needs no more, for one Gem, of a Dram, is worth more than ſeveral Ounces of Gold. After we have briefly underſtood, how to make good Profit with our Red coagulated Oyl of *Antimony* and *Mars*, before it is yet fixed, with the imperfect Metals and Gems: You ſhall alſo hear what it will do, when fixed. And this you muſt know, that if a Tincture very well prepared, can endure melting in the Fire, yet for all that, it may not be accounted fixed; for inaſmuch as they are made out of unfixed Metals, they cannot themſelves be fixed; if one ſhould object, and ſay, that the Tincture was drawn out of fixed Iron, and therefore it muſt alſo be fixed, although the *Antimony* was not fixed: I anſwer, that Iron cannot be called fixed, although it doth not fly in the Fire, for *Saturn* can ſtill devour it, but this only is to be reputed fixed, which endures the *Cupel*, which neither ♂ nor ♄ doth. Therefore the Tinctures which are extracted out of them, cannot endure the *Cupel* before they are made fixed. For which reaſon the highly experienced Philoſopher *Paracelſus* tells us, that we muſt not take common Iron to draw our Tincture, but ſuch as cannot be again reduced into Iron, which we muſt ſeek in the green and blue *Scoriæ*, out of which Iron hath been melted by the ſtrength of Fire, and are caſt away. Becauſe the Iron, and alſo every imperfect Metal, containeth two ſorts of *Sulphur*, *viz.* a combuſtible, and incombuſtible; the combuſtible is melted by a ſtrong Fire, into a dead Glaſs, but the incombuſtible remains unhurt, hidden in the ſaid Glaſs, and may be drawn out of it by Art, and brought into a Tincture, that will endure the *Cupel*. I could cite *Paracelſus* for ſeveral other things, becauſe he writes very honeſtly, but it is not here convenient. It would be very well, if ſome one would reprint this Treatiſe, for it is out of Print, that the way to the Truth might be ſhewn to them that err. And if none will do it, I ſhall do it my ſelf, for it is commendable to preſerve a lighted Candle, and not ſuffer it to go out. This is enough of the Fixation of *Paracelſus*, which is done by the great ſtrength of common Fire. Now we will alſo hear, how this Fixation may be effected by an artificial moiſt Fire, much eaſier than by the former. In my Treatiſe lately publiſhed of the *Three Principles of Metals*, I have taught how any combuſtible *Sulphur* may be fixed in a very few hours, ſo that no Fire can any more hurt it. Now if ſuch a quick Fixation of combuſtible *Sulphur*, can be done with a moiſt Fire, as I have ſhewn it may in the ſaid Treatiſe, what may not be done, by the ſame Fire in the more fixed Metals, ſuch as Iron? I have alſo ſhewn in the ſame place, that ♄, as well as common ♃, may be made fixed in few hours, I have alſo ſaid that ♄ and common ♃, ſo fixed have no ingreſs into Metals. After that, I have alſo taught, how to procure this ingreſs by common Gold, if the Gold and the *Sulphur* be united, and then a a fixing *Aqua Fortis* drawn from them, that then it can never be ſeparated from the Gold, but that the Gold ſo preſerves it upon the *Cupel*, that *Saturn* cannot enter it: Now if this may be done with common *Sulphur* and *Antimony*, why not alſo with *Mars*, which in its Nature approacheth Fixity? Therefore it behoveth, that we ſhould fix our Tincture of ♂ and ♄, after the ſame manner being united with ☉, by the Humid fire, that both may be permanent upon the *Cupel*. For without this Fixation nothing of moment can be done. For if theſe Tinctures be added to Silver, and are not conſtant in the Fire, they with the Silver, become Metals again, vaniſh upon the *Cupel* with ♄, and leave the ☽ nothing bettered. Therefore nothing elſe is to be obſerved, but to bring into Perpetuation the prepared Tinctures of ♂ and ♄, by the addition of Gold, and the due Abſtraction of the fixing Waters; and then the Tinctures remain with the Silver unſeparable, and the devouring *Saturn* cannot hurt them upon the *Cupel*. Let this ſuffice concerning the particular Fixation of our Red Oyl of ♂ and *Antimony*. Now followeth, how to make an univerſal Coagulation and Fixation of this Oyl. *The*

The PROCESS.

℞. THree or four Ounces of our Coagulated Oyl of *Mars* and *Antimony*, into a Red Stone by the help of ☿, grinde it into an impalpable Powder, and draw from it ten or twelve Ounces of ſtrong *Aqua Fortis*, which hath been firſt abſtracted from decrepitated Salt, and in which is diſſolved half an Ounce of Gold: Secondly, and Thirdly, abſtract from it again freſh *Aqua Regia*, but without Gold; then the Gold will radically unite it ſelf with the Tincture of *Mars* and *Antimony*, and they will be conſtantly fixed together, by means of *Aqua Regia*. When this is done, pour upon it a good quantity of common Water, let it boyl for ſome hours, and it will draw out the ſharp Spirits, which remained with the Tincture, this may be once or twice repeated, then dry it, and it is fit to tinge Silver into Gold. This Tincture melts as eaſily as Wax; the *Saturn* which is mixed with it, doth not hinder it, it is true, he goes into the Silver with the Tincture, but is eaſily ſeparated by the *Cupel*. I could ſet down many more Dexterities, in the Preparation of this Tincture, but it would ſwell too much, it being already greater than I expected, for I only thought to have annexed this to the Appendix, as a Corollary, but it is grown bigger than the Appendix it ſelf. Here ſhould have been added, how this Tincture of *Antimony* and *Mars*, by the help of our *Alcaheſt*, might be made into a conſtant Tincture, eaſily and in great quantity, without Coſt; ſo compendiouſly, that in three or four days time, a good quantity of Tincture may be made fit to graduate a great part of Silver into Gold: But the time will not allow me here to inſiſt any farther on it, but muſt defer it the ſecond Appendix, where the Reader will find greater Contentment. For this work is ſo eaſily done with the *Alcaheſt* without great Coſt, that the moſt ordinary *Mechanick* may imitate it, and profit by it. There will come another World, when Art will flouriſh, and Pratlers periſh. Take notice of this, for the time is at hand, *Elias* the *Artiſt* will ſoon appear, of this Read *Paracelſus* in his Book of *Vitriol*. At ſuch a time there will be great changes in *Europe*, and chiefly in the *German Empire*, *France* and *Swedland*. For *Elias* the *Artiſt*, it may be, when he comes, will bring with him ſome Military inventions, and by his great Power eſtabliſh the Fifth Monarchy. That in theſe times great Changes will be in *Europe*, is not to be doubted, for the Heavens do foretel it. God ſend us what is good, there being now nothing of good left, how then is it poſſible, it ſhould remain longer in Peace?

OF ELIAS the ARTIST:

OR,

What we are to underſtand by Elias the Artiſt, and what he is to reform in the World at his coming.

VIZ.

The true Spagyrical Medicin of the Ancient Egyptian *Philoſophers, which has been loſt for above* 1000 *Years, and will be reſtored by him, and illuſtrated with many new Inventions, by rejecting much unprofitable Smut-work, and pointing out a nearer and better way to obtain good Medicines, with little Trouble or Charges; which true Medicine he will bring along with him, and declare the ſame to the preſent deceived World. Tranſlated out of the* High-Dutch.

Courteous Reader,

TOwards the end of my laſt publiſhed Treatiſe concerning the Infernal *Goddeſs Proſerpina*, I took occaſion to mention, that probably ſoon after my Death, the long-ſince fore-told *Elias Artiſta* would appear, and bring along with him a great Light, to enlighten the dark World, enabling them to reject the Evil, and embrace that which is good: As likewiſe, that many great changes will happen in divers Kingdoms, and eſpecially in the *Roman* Empire, where one Potentate will overcome the other, and make himſelf Maſter of his Dominions. I there alſo ſhewed what, *Paracelſus* hath declared concerning *Elias Artiſta*, and fundamentally confuted the groundleſs Opinion of ſome Perſons concerning the ſame in my Fourth Part of the *Proſperity of Germany*, ſhewing that that Prophecy

phecy is not to be underſtood according to the Letter, and to be meant of ſome great Man in the World, but Magically; for the word *Elias* by tranſpoſition of Letters, makes out *Salia*, and ſo likewiſe doth the word *Eliſha*, as I have formerly explained theſe words in my Treatiſe *of the Nature of Salts*. *Elias Artiſta* therefore according to the ſtyle of Philoſophers, ſignifies extraordinary and unknown Salts, by which great and incredible things may be performed, and accordingly when manifeſted, will be the cauſe of great changes in the World.

Theſe Salts were known to the Philoſophers of old, who yet did not think fit any further to open themſelves concerning them, than in declaring, that the Philoſophers Stone muſt be prepared by them. *Turba Philoſophorum* ſpeaking concerning this matter, ſaith, *This our Salt encreaſes the Redneſs in* ☉, *and whiteneſs in* ☽, and further, *if God had not created this* Salt *it were impoſſible to make the Elixir*. It is probable, that the Philoſophers who wrote concerning this wonderful *Salt*, had no knowledge of any other, ſuppoſing that this *Salt* only was proper to extract and prepare Tinctures. I muſt acknowledge there is no *Salt* in the World, that hath ſuch virtue to encreaſe and exalt the Tincture in common as well as Philoſophical ☉ and ☽, and that as it were in a moment, as ſoon as the Monarch of *Salts* is added to them. Neither doth our *Salt* only exalt, but it alſo joyns the King of Metals ſo indiſſolubly with his Queen, that no Art can ſeparate them. A thing worth our wonder, that a Volatile white *Salt* ſhould have the power to meliorate ☉ and ☽, and to exalt the ſame permanently. For to give ſome further light to the matter, I declare, that this *Salt* of which the *Turba* ſpeaks, doth ſublime white, and being diſſolved in Water, gives a white Solution: It is white, and continues white both in and out of the Fire, and is altogether Volatile, for which reaſon I have called it my *Secret Salt Armoniack*; but as ſoon as it is join'd with ☉ or ☽ it becomes fix, and makes the ☉ and ☽ fixer than they were before, affording them a kind of *pluſquam* perfection, and inſeparable Conjunction. Let none think that this *Salt* of which I here ſpeak, is like, or the ſame with that, which is made of Oyl of Vitriol and Spirit of Urine, of which I have treated in the Seventh Part of my *Pharmacopæa Spagyrica*; for this our Sovereign *Salt* has no affinity with that, for as much as that *Salt* makes all things Volatile, and ſeparates their purer part by Sublimation from the groſs *fæces*; but this our white *Salt*, though it be unfixt it ſelf, yet has the power to fix unfixt Metals, ſo as to endure the Teſt, provided always that the virtue of this unfixt *Salt*, be firſt fixed by its conjunction with ☉ and ☽. For the whole ſubſtance of this *Salt* (which the Philoſophers have called a Biſhop or High Prieſt) when ☉ and ☽ as King and Queen are inſeparably join'd by it, doth not abide with the ☉ and ☽, but only by its hidden Tincture and Virtue, whereby it exalts all colours, the unprofitable body of the *Salt* ſeparating from them, as ſoon as the Conjunction is made, even as a Prieſt, when he has join'd two Perſons in Wedlock goes his way, having performed his Office. And indeed this inſeparable Conjunction of ☉ and ☽, may well be compared with the Conjunction in Marriage performed by a Prieſt; for as when the Prieſt has join'd two Parties together in Wedlock, they muſt inſeparably continue ſo till death; ſo likewiſe when the Metallick Copulation of ☉ and ☽ is performed by means of our Metallick High Prieſt, conſecrated by *Jupiter*, then are their Bodies thence forward inſeperable; the Water finds no ingreſs into them, the Air cannot pierce them, and Earth much leſs, yea, the ſtrongeſt of all Elements, the Fire hath no power over them, but, like a Married Couple, abide together in all contrariety and adverſity, and according to their Kind do multiply *in infinitum*, being ſupported with due Food and Nouriſhment; for we know, that except we be refreſhed and ſtrengthened with Meat and Drink, we can neither live nor multiply; the multiplying virtue in many and all Creatures proceeding from the Nouriſhment they take in. And the ſame we are to underſtand alſo concerning the Metallick Multiplication, for when ☉ and ☽ are permanently conjoined, by means of the Metallick High Prieſt, this alone is not ſufficient in order to their multiplication, but they moreover muſt be ſupported with convenient Meat aud Drink. And as Man at his firſt coming into the World is nouriſh'd with his Mothers Milk, in like manner the Philoſophers do feed their ☉ and ☽ with their Mothers Milk, that is, with their firſt Eſſence, from whence they deriv'd their Original. Now we know that in contemptible *Antimony*, the firſt *Ens* of ☉, is copiouſly to be found, and may with eaſe be drawn thence, in the appearance of Milk, with which ☉ and ☽ are to be nouriſhed in order to their Multiplication and Increaſe. The Nouriſhment then wherewith our conjoined ☉ and ☽ are to be refreſhed, and diſpoſed to a Multiplication *in infinitum*, is our *Lac Virginis*, Virgin Milk and Mercurial Water, which ſtrengthens and increaſeth the Procreative Seed in ☉ and ☽ both in quantity and quality. Wherefore alſo this feeding or incération has always been recommended by the Philoſophers, as a moſt neceſſary thing, whereby, as it were, a new life, and multiplying virtue is communicated to the inſeparably united ☉ and ☽.

Furthermore we are to know, that after common ☉ and ☽ by means of the *Salt* of Art, are inſeparably conjoined and exalted in their colours; yet nothing can be performed with them, becauſe they want an ingreſs into other Metals, which they have loſt by their Conjunction, which therefore muſt be reſtored to them by means of our mercurial Water, which not only communicates Ingreſs, but alſo eaſie Fluxibility and Multiplication to the deſtroyed Bodies of ☉ and ☽. For when our ☿ Water is fixed in Conjunction with the fixt ☉ and ☽, then it is no longer a Volatile ☿, but is changed by the exalted ☉ and ☽ to a fixt Tincture. This done, if we would multiply this Tincture, we muſt add to it ſome of our *Mercurial* Water, and fix them together as before, which Multiplication we may repeat as oft as we pleaſe. For when once ☉ and ☽ are made irreducible and more than perfect, by means of our *Salt* of Art, we need never after to begin our Work a-new, but only mingle the fixt with the volatile in order to their Fixation; ſeeing that our *Mercurial* Water is in its inſide better than ☉, for which reaſon alſo it turns the ☉ and ☽ when fixed with them into mere Tincture. Let no Man wonder why in this Operation we join ☉ and ☽ together, and not rather make uſe of ☉ alone, foraſmuch as this ☽ hath no colour at all outwardly, though in its inſide it be higher of colour than ☉ it ſelf, both which Metals nevertheleſs, except their colours be exalted by the *Salt* of Art, and Inceration, without our *Mercurial* Water can never be changed into a true Tincture, becauſe ☉ and ☽ have no more Tinctures than is ſufficient for themſelves, but being exalted by the tinging *Salt* of Art, they are capable of colouring white Metals, but not before. Indeed ☉ alone without the addition of ☽ may be exalted by our *Salt* of Art, and *Mercurial* Water

ter into a Red Tincture. In like manner alſo may ☽ alone be exalted in its whiteneſs by our *Salt* of Art, and ☿, one part of which exalted ☽ tingeth many parts of ♀ into good and fixt ☽, for our ☿ wherewith we incerate and multiply, may be fixed into a Red or White Tincture, according to the ferment we joyn with it, with ☉ it makes a red, and with ☽ a white Tincture. However the beſt way is to put ☉ and ☽ together in due weight and proportion, exalting them with the *Salt* of Art, by which means the whiteneſs in ☽ when join'd with ☉, becomes changed into Redneſs, of which mine Eyes are Witneſs. Of this Exaltation of ☉ into a high purple colour, and of ☽ into the higheſt whiteneſs, I gave an Ocular Demonſtration to ſome of my Friends, before my Sickneſs, but none of them have ſince undertaken the Work, and my ſelf by Sickneſs have been hindered hitherto.

Ovid excellently deſcribes the preparation of this Tincture, where he tells us, that *Jupiter*, having chang'd himſelf into a Golden Rain, fell through the Tiles into the Lap of *Danaë*, (ſhut up by her Father *Acriſius* King of the *Argives* in a ſtrong Tower) and got her with Child, of whom afterwards *Perſeus* was born, who in proceſs of time being mounted on the Winged Horſe *Pegaſus*, killed the Sea-Monſter, delivering the fair *Andromeda*, whom he took to Wife; and afterwards vanquiſhed the *Gorgons*, and made himſelf Maſter of the Golden-fruit-bearing-Orchard. In which Fable the whole Work is clearly and punctually deſcribed, but the reaſon why it is ſo little underſtood, is, becauſe ſo few makes it their buſineſs to conſider thereof, or put their hands to the Work. For attentively conſidering the matter, we find that the King of the *Argives*, in the ſenſe of the Philoſophers, is our Black Lead, whence we prepare our Snow-white *Virgin Milk*, or Mercurial Water, which is the Beautiful *Danaë*, that becomes inpregnate by *Jupiter*'s Golden Rain. *Archivum* ſignifies a Treaſury of ſecret and important Records, and no Subjects contains more ſecrets, than doth our Black *Magneſia*. What is more lovely to behold than *Jupiter*'s Golden Rain, whereby the fair *Danaë* becomes impregnate? And from whence does this Rain proceed, but from our *Salt* of Art, without which it were impoſſible for ♃ to change the ☉ into ſuch a deſirable Rain? What is the Beautiful *Andromeda* elſe, but *Diana* the Conſort of *Apollo*, who is expoſed to the Sea-Monſter to be devoured, and is delivered by *Perſeus*. And, in a word, the whole Work of preparing a Tincture from the foreſaid Subjects is ſo clearly ſet down by *Ovid*, as it could not well be ſet down more clearly; and yet how little is it underſtood, by reaſon of the general Stupidity and inadvertency of the Readers. I have here diſcovered all the ingredients belonging to this Tincture, ſo as nothing remains, except putting hand to the Work, and begging God's Bleſſing upon it: For no good thing was ever the effect of idleneſs: But Praying, Seeking, and unwearied Labour, are the Well-Springs of all uſeful Arts.

And herewith I ſhall conclude the uſe of the *Salt* of Art, in preparing the univerſal Tincture upon all Metals, tranſmuting the ſame into ☉ and ☽. I ſuppoſe it hath been ſufficiently made out, that the foretold *Elias Artiſta* is nothing elſe, but this our *Salt* of Art, whereby the Redneſs in ☉, and Whiteneſs in ☽ are exalted into Tincture. Wherefore alſo this Salt, by thoſe who know its uſe, has been called the Monarch of Salts: For every Species of things hath its Monarch, excelling all the reſt of the ſame kind; upon which account, *Paracelſus*, who in his Life-time had not his Peer, obtain'd the Title of Philoſophers, Phyſicians and Monarch of Chymiſts. Foraſmuch therefore, as our Salt of Art hath not its like in the World, for working Wonders in *Alchimy*, it may well be call'd the King of Salts: Tho' indeed there be one only Salt which excels him, as far as *Elias* excell'd his Servant *Eliſha*: For as *Elias* went up to Heaven in a fiery Chariot, leaving his Mantle to *Eliſha*, ſo this Salt may more properly be compared to *Eliſha* than *Elias*, becauſe *Eliſha* ſtaid here beneath, and did not aſcend to Heaven, as *Elias* did. Now the Chymiſts generally prefer that, which aſcends by the force of the Fire, before that which ſtays behind, tho' this Rule be not without Exceptions; for that which remains is not always to be rejected, becauſe ſometimes much good lies hid in it: As we may perceive in *Elias* his Aſcenſion to Heaven, who left his Mantle behind, which was not without Virtue, as appeared when *Eliſha* with it divided the River *Jordan*, going over dry-ſhod. The Chymiſts commonly call that which remains after Diſtillation, or Sublimation, *Caput Mortuum*, but without good ground, becauſe in that which ſtays behind, often a great vivifying Virtue lies hid. This we may gather from the Virtue (as has been ſaid) remaining in the Mantle of *Elias*, and in the dead bones of *Eliſha*, which as ſoon as it touch'd the dead Body, raiſed it again to Life: If *Elias* his Mantle had been a dead thing, *Eliſha* could never have divided *Jordan* therewith, nor could *Eliſha*'s bones have raiſed the dead to Life, if they had been dead and without Power. Conſider well what I have ſaid, and you will find more in it, than I dare more plainly declare; remembring always, that *Jordan* is nothing elſe, but our ☿ Water.

Concerning the Salt *of Art.*

Having already heard, how by means of the fixative *Salt* of Art, common ☉ and ☽ may be prepared into a Tincture, for the cure of Men and Metals; it now remains to be declared, how, by means of the Volatilizing *Salt* of Art, moſt excellent Medicines may with eaſe, and ſmall Charges, in a very ſhort time be prepared, out of all Vegetables, Animals and Minerals. We are here to take Notice, as has been already hinted, that the Property of our *Salt* of Art, is, to make the volatile *Metallick* Subjects fixt; of which fixative Property, notwithſtanding it may in a few hours, eaſily and without Charges be deveſted, and a Power of Volatilizing all things introduced into it, inſtead thereof, by which, incredible things may then be performed, both in Phyſick and Alchimy. Of which Wonder-working *Salt*, the preſent World knows nothing at all, and probably nothing will be known of it, till God ſhall permit it to be revealed by *Elias* the *Artiſt*. What I know of it, I am willing to communicate for common Good, not doubting, but that God in his due time by means of Good men will reveal the reſt. To volatize this fixative *Salt* of Art, is an eaſie thing to the Wiſe, but to the Ignorant altogether incredible; though it be no difficult thing to me, to make it credible and apparent, which if thou wouldeſt do likewiſe, proceed thus: Pour upon our *Salt* of Art, in due proportion good Spirit of Wine, which draw off by Diſtillation, and you will have a wonderful Spirit, of great Virtue; but you will find your *Salt* of Art ſo weakened, as it cannot be uſed again: But the Spirit of Wine, impregnated with the Virtue of the *Salt*, performs Wonders, that were never yet made known to the World, of which we ſhall hear more

hereafter. For the Spirit of Wine in this abstraction hath its Virtue multiplied ten fold, so as it not only extracts the Essence of Vegetables, Animals and Minerals, both easily and suddenly, carrying them over the Helm; but also extracts the Tinctures from ☉ and ☽, and all precious and common Stones, and brings them over. Of which Extraction and Separation of the tinging Soul from fixt and unfixt Bodies, no Philosopher hitherto hath divulged any thing. Let us now take a view of the great Secrets, which may be obtained by means of our Alcolized Spirit of Wine. *Paracelsus* had an Alcolized Spirit of Wine, which he called *Alcohol vini*, with which he did great things; but it is not likely, that his *Alcohol vini* was of the same Virtue, as mine here described; for if so, it could not have been so long concealed. However it be, we cannot deny *Paracelsus* the Title of Monarch of Physicians and Alchymists, though he may have been ignorant of our *Salt* of Art, with which our *Alcohol vini* is prepared; for no Body knows all things; and God bestows his Gifts, as best pleaseth him.

But to our return to our *Alcohol vini*, and the manner of using it. First we are to take Notice, that as for Vegetables and Animals, they are to be reduced to Powder, if they be dry, but if fresh, they need only to be a little bruised or chopt, and then pour upon them our *Alcohol vini*; if the Subjects be dry, we may digest a while before abstraction, but in Case they be moist, we may distil the Spirit immediately, which carries over with it all the Virtue of the said Vegetables and Animals, together with the Taste and Smell, and poured upon Flowers, and distill'd, sometimes brings over their Colours also, which hitherto hath been looked upon as very difficult, if not impossible. But before we make use of it upon Minerals, we must prepare them, for our *Alcohol vini* is not strong enough to lay hold on hard Minerals, and compact Metals, so as to extract their Essences, and therefore they must be first opened with Waters, that are not Corrosive, and afterwards be digested with our *Alcohol vini* and then distilled; which being performed in this Order, the *Alcohol* will carry their Essences with it over the Helm. This is the true Preparation of Vegetables, Animals and Minerals, in order to the extracting of your Essences, by means of our *Alcohol vini*. But here we must observe, that this Preparation of fixt Metals, by opening of their Bodies, must be done with fixt Liquors, and not Volatile; for if the dissolvent were Volatile, it would come over in Distillation with the Spirit of Wine, and spoil all; because after Distillation, the Spirit of Wine must be separated from the Essence it hath brought over with it; now if the dissolvent, by being Volatile, should come over the Helm, it would remain with the Medicine, and consequently spoil it. We are therefore to remember, that this dissolvent must be Firey, not Corrosive, without any Smell or bad Taste: The dissolvent being as necessary to our Work, as is the Spirit of Wine it self: Wherefore he who intends to plant good Fruit, in this Gold-bearing Orchard, must be provided with both these Keys, *viz.* with a *Menstruum*, not Corrosive, to dissolve Metals and Minerals, and with a well prepared Alcolized Spirit of Wine, without which, he cannot obtain the Tincture of Metals.

Having thus spoken of the foregoing Preparation of Vegetables, Animals and Minerals, in general: I shall now proceed to shew in particular, how out of them most surpassing, and excellent Medicines may be prepared.

And first to begin with Vegetables; their Essences are to be distilled in *Balneo*, with a moderate heat, changing the Recipient when it is needful: For that which comes over, first is of another Nature, than that which distils next, and that again differs from that which comes last. There are some Vegetables, that first give their best part, and the worst last, whereas in others, the worst comes first, and the best stays till the last. For the rest, it is easily apprehended, that the Virtue of Flowers and Herbs, especially when green and tender, doth more easily yield to Distillation, and come over sooner than the Essence of hard Wood, which is more closely shut up in its Body. He that proceeds aright in this Work, will meet with great delight and Satisfaction, and bless God for the Communication of this Light. For our Alcolized Spirit of Wine brings over Vegetable Essences, of a most fragrant Odour, which common Spirit of Wine can never do: We may indeed extract Vegetables, and Minerals with common Spirit of Wine, but cannot carry the said extracted Essences over the Helm: Which extracts made with common Spirit of Wine, are not to be compared with those, which our *Alcohol vini* brings over with it, differing as much as the shell from the kernel. For our Essences, as soon as they are taken into the Body, penetrate it throughout, passing every where to find out their Enemies, and when found Attack, and put them to flight, which gross Medicines cannot perform. The like Virtue is also in those ☿ *Salts*, Tinctures or Souls of Metals, that come over in the flame of the distilled Spirit of Wine, which also penetrate the Body throughout, chasing their Enemies before them; and the Tinctures of Stones in the same manner prepared do the like. Which we must not so understand, as if the Alcolized Spirit of Wine were to be taken into the Body, together with the Tincture, for indeed it must be separated from it. As for instance, when I have brought over the Quintessence of Flints or Crystals, with our *Alcohol vini*, and have a mind to make use of it against the Stone in the Bladder or Kidneys, or Stones that are grown in the joynts, I must not exhibit this Essence, as it is mixed with the Spirit of Wine, for if so, the good effect, that might be looked for from the Essence, would be spoiled by the great heat of the Spirit of Wine, which is the reason the same must be separated from the Essence, before it can be given inwardly. Now this Separation cannot be done by Distillation, because both would come over together. Neither can the Tincture, or Essence of the Stone, be separated from the Spirit of Wine, by Precipitation. What is to be done therefore in this Case? The only way to attain our desire is, to kindle the burning Spirit, and let it flame away under a large and capacious Helm or Head, made for that purpose; by which means the Spirit of Wine is consumed in the flame, and the incombustible Essence of Crystal remains in form of a sweet and pleasant Oyl. We are also to note, that in this burning away of the Spirit of Wine, the *Sulphur* of Wine only is consumed, and the incombustible ☿ of Wine, being condensed in the Head, falls into the Receiver, in the appearance of a sweet Water. [*see more of this instrument in the Sixth Part of Phar. Spagyr.*]

N. B. We are to observe, that the most highly rectified Spirit of Wine, is much about half water, which water ascends with the flame, and is caught in the Recipient. Yet is not this ▽ any common ▽, but indeed a powerful ▽ of Life, especially when the Spirit of Wine hath been rectified from Aromatical,

tical, or Medicinal Subjects, but even without this, it is of very good use, because the incombustible ☿ of Wine lies hid in it, and may be separated from it, by abstracting the said ▽ in a very gentle vaporous Bath, which done, the ☿ of Wine stays behind, in the form of a white lovely *Salt*, full of heavenly Powers and Virtues: For which cause this *Salt* or ☿ of Wine, hath been always termed by the Philosophers, Heavenly *Salt*.

It is likewise to be noted, that after the ▽ is abstracted from the Spirit of Wine, the said ▽ is not devoid of all Virtue, as invisibly containing some part of the foresaid Heavenly *Salt*, especially if the Spirit of Wine in its Rectification, hath been impregnated with Spices, or other good Subjects: For according to the different impregnation of the Spirit of Wine, the Heavenly *Salt*, or ☿ of Wine, will be more or less powerful. Thus we have seen in what manner the Essences of Flints and Chrystals are to be prepared, with the help of our *Alcohol vini*.

When this Spirit of Wine Crystallized is kindled and burnt away under a large Head, the greatest part of the Essence of Crystals remains behind, in the form of a pleasant clear Liquor, which is the most Sovereign Medicine against all Diseases proceeding from *Tartar*, *viz.* Stone in the Bladder, Kidneys and other parts of the Body, which it dissolves, and carries off. But the most pure part of the Crystals mounts with the flame into the Helm, in form of a clear Water, which when abstracted in a vaporous Bath, the ☿ of Crystals stays behind, in form of a lovely white *Salt*, which is of far greater power in the Stone, Gout, and like Diseases, than the fixt Oyl or Liquor, which remains in the Vessel after the Spirit of Wine is burnt away. In like manner, we may proceed with other Stones. Yet we are to understand, that all Stones have not the same Nature or Property: Thus we find several sorts of Crystal, *viz.* some White, Transparent and clear, others White, but *Opake* and dark, also Green, Blew, Yellow, Red, and Black Crystals, all which by the help of *Salts*, are melted into Glass of several Colours. Amongst these Crystals are also reckoned. Flints, Pebbles, Gravel and Sand, which likewise suffer themselves with *Salts* to be melted into Glass. All these forementioned Stones, may with *Alkalick Salts* be melted, and afterwards by *Deliquium* be resolved into a Liquor, concerning which Liquors, I have treated at large in the Second Part of my Furnaces.

These Stones that suffer themselves to be melted, with the Addition of *Alkalies*, may also, with Lead-ashes, be reduced to transparent Glass. Whereas precious Stones, *viz.* Diamonds, Rubies, Saphirs, Jacinths, Granates, *&c.* are of a quite different Nature, which neither by *Alkalies*, nor Lead, can be run down into Glass: Wherefore also none have been found hitherto, that have been able from them to prepare any good Medicine, as not yielding to the most Corrosive Waters whatsoever.

N. B. And though indeed, I know a way to dissolve them without any Corrosive, yet do not I think it proper, to Communicate the same in this publick manner.

There is another sort of Stones, which are commonly found in Rich and fat Earth, and sometimes also in Rivers or Brooks, such as *Lapis Judaicus*, *Lyncis* and others, which being not very hard, may be dissolved in good Spirit of Salt, which Solutions are by some of our common *Chymists* used against the Stone, but without any good Success, forasmuch as the Body of the Stone is not at all meliorated by being dissolved in Spirit of Salt, but rather made worse; because by this means, there is no Separation of the pure from the impure. But if any Man will take the pains to reduce these Stones into Essences, in the way before specified, he will find them much more available in all sorts of *Tartarous* Distempers.

There are also several kinds of Lime-stone, which cannot be melted with Addition of *Alkalies*, or the Ashes of Lead, but by a strong Fire are burnt into Lime. Amongst which Lime, Stones, we may reckon the *Ludus* of *Van Helmont*, which like other Lime-stones, may be sublimed with our strong ☓, and afterwards reduced into a Liquor, of which I have treated elsewhere, and particularly in the Seventh Part of my *Pharmacopœa Spagyrica*. Out of these Stones, after they have been first burnt into Lime, a most excellent Medicine may be prepared against all kinds of the Gout: *Basil Valentine* assuring us, that he with Essence of quick Lime, cured the Chancellor of the Emperour of *Germany* of the Gout: Which we may the rather believe, because *Basil Valentine* knew the way of separating the ☿ from the Spirit of Wine, by enkindling it; and hath also described an instrument of Copper, for performing that Operation: And knowing all this, he could not be unacquainted, that the Essence of Quick-lime, being united with Spirit of Wine, and afterwards meliorated, and putrified by burning it away, was separable from it, which he having reduced to Practice, obtained this excellent Medicine for curing of the Gout.

We are further to know, that there be other, and better Stones, to prepare an universal Medicine against the Gout and Stone, by means of our *Alcohol vini*, after they have been first burnt into Lime, *viz.* Oyster shells, which, being burnt, afford a Lime that is very Caustick; and of a like Nature are all Sea-productions, *viz.* the Stones that are found in Spunges, all sorts of Coral, Pearl, and Mother of Pearl, all which may be reduced by Fire, into a Lime of great and excellent use.

But above all other Stones, I esteem those that are found in Beasts, Birds, Fishes or Man, which being reduced into a Calx, and their Essences extracted with our *Alcohol Vini*, may then be brought into a pleasant Liquor of great Use.

Amongst Fishes, the best Stones are found in Haddocks and Whitings, Crabs Eyes also are very good, but must be calcined before they can be of any good use in Physick; for without that, they are more proper to generate the Stone, than to expel it.

Having thus declared, how, from some Stones, good Medicaments may be prepared against the Gout and Stone both of the Bladder and Kidney; we will next shew, what kind of Stones are proper to be extracted with our *Alcohol Vini*, in order to the obtaining of true Tinctures for Men and Metals. For all Stones that have good fixt colours, are not therefore fit to have their Tinctures extracted; because some of the Precious Stones are too costly, though we should only make use of their Fragments. Some will not submit to any Operation, *viz.* Granates, Saphires, Rubies, Jacinths, Emralds, Turkoises, *&c.* though they abound with much fixt Tincture; whereas all those Stones which are high of colour, and suffer themselves to be dissolved, are proper for this work, because without preceding Solution, it is impossible to extract the Tincture from hard and compact Bodies: Wherefore we must make choice of Stones that are soluble, and abound with fixt Tincture, *viz.* Green and Red

Jasper

Jaſper Stones, *Lapis Lazuli*, and the Black *Magneſia* which contain abundance of Solar Tincture. All Stones likewiſe that are high coloured, and break ſmooth like Glaſs, whether found on Mountains or in Brooks, are good for this purpoſe.

It was becauſe of this Solar Tincture abounding in the Jaſper Stone, that the Ancients preferr'd it before ☉, as containing a moſt high and excellent Tincture. A very rich Tincture may alſo be extracted from the *Lapis Lazuli*; and from the Black *Magneſia*, (which is not coſtly) a richer. Let us therefore take this deſpiſed Stone in hand, and ſee how eaſily its Tincture, by means of our *Alcohol Vini* may be extracted, and what uſes it ſerves for, as well in Phyſick as Alchimy.

The PROCESS.

℞. ONE pound or two of black and ponderous *Magneſia*, pulverize the ſame, and diſſolve it in our Univerſal Stone-Water, wherewith all hard Stones may be diſſolved, and thou wilt have a Solution of a Graſs-green-colour, filter it, and in caſe thou haſt proceeded aright, the undiſſolved *fæces* will be of ſmall quantity.

Now is thy Solution ready to have our *Alcohol Vini* pour'd upon it, in order to the extracting of its Tincture, and carrying it over the Helm.

N. B. That notwithſtanding the Solution be at firſt of a green colour, yet the Spirit of Wine in Diſtillation comes over yellow as *Sol*. And when the Spirit of Wine is kindled under a large head, the pure *Mercury* of the *Magneſia* aſcends with the flame, which is of great uſe in Phyſick; and a Blood-red Liquor ſtays behind, being not only a Tincture for the Bodies of Men and Metals, but alſo by means of the ſame may Cryſtals be tinged with ſeveral fair colours, ſo as to reſemble Precious Stones in all things, except hardneſs. I dare not ſet down here the manner of applying this Tincture to white Metals, he to whom God vouchſafes this Tincture, will eaſily find out the uſe of it.

As to the Phyſical uſe, this Tincture opens Obſtructions of the Liver, Spleen and Lungs: The white *Mercury* come over with the Flame is an excellent Medicine, ſtrengthening the Heart, Stomach, Head and Reins, and a great Remedy againſt the Gout. In a word, he that is Maſter of this Tincture will find much more in it than I have here hinted.

In like manner, as hath been ſaid of the *Magneſia*, we may proceed with other Stones, to extract their Tinctures, all which have different properties, according to the nature of the Stones from whence they are prepared.

We proceed now to ſhew, how by means of our *Alcohol Vini* the Tinctures or Eſſences of Minerals and Metals, without any preceding Solution, or other preparation, may be eaſily brought over. The way is thus:

℞. What quantity you pleaſe of any Sulphurous Marcaſite, whether of ♂, ☿, ♃, ♄, ☽ or ☉, make them red-hot in a Crucible in a Wind Furnace, and then put them red hot as they are, into my ſecond Diſtilling Furnace, fitting a large Recipient thereto, and pour upon them to the quantity of about an Ounce of our *Alcohol Vini*, cloſing the Furnace again immediately; by this means the Spirit of Wine will enter into the Stones, yet becauſe of the great heat will not long continue there, but aſcend and carry over the Metalline Spirit with it; which done, pour upon them another ſpoonful of Spirit, which when come over, pour on another, repeating this as oft as ſhall be needful. After that the Marcaſites or Metalline Stones are grown cold, they muſt be made red-hot again, and proceeded with as before, till a ſufficient quantity of the Metallick Spirit be obtained. Then burn away the Spirit of Wine, and there will remain a glorious Eſſence of Metals, which thou mayeſt make uſe of, according to thy beſt knowledge. One thing I can aſſure thee, that this is the eaſieſt way to obtain Metallick Spirits in quantity. And though the Proceſs appears plain and ſimple, yet more may be diſcovered and attained thereby than many would imagine. I know what I write, though it may be every Man will ſcarcely underſtand me; which is very fitting, to the end theſe great *Arcana* may not be proſtituted to the Unworthy. He, who cannot make Metallick Spirits according to this way, may diſſolve the Metals themſelves in proper Diſſolvents, pour Spirit of Wine upon them, and diſtil their Eſſences, which he may then make uſe of, as his underſtanding ſhall guide him.

I have already declared, that Metallick Spirits, when pour'd together, do Meliorate one another. I ſhall add no more at preſent, having already declared too much to the Unworthy, and for thoſe that fear God, they will be further aſſiſted from above, and led to the deſired end.

In like manner may the Eſſences of all common Stones, Pebbles, Metalline Stones, colour'd Earths, *&c.* be extracted without any foregoing preparation; for which God be praiſed for evermore. *Amen.*

In the ſame way we can obtain the Eſſences of many other Mineral Subjects, without any preceding preparation, eſpecially of ſuch as are Volatile, *viz.* Kobolt, Arſenick, Orpiment, Biſmuth, Zink, *Lapis Calaminaris*, and the like Realgars, from which we may diſtil very poiſonous, but withal admirable, Spirits, in order to the Melioration of Metals. We may alſo take the ſame courſe with compact Metals themſelves, and diſtil their Spirits without any foregoing Solution, *viz.* we muſt file them ſmall, make them red-hot, and put them into the Diſtillatory, and then proceed as before hath been ſaid with the Marcaſites, and the Metalline Spirit will come over with its natural ſmell, taſte and colour, in which Spirits great wonders lie hid, but are of greateſt uſe in Meliorating of Metals. Read what *Paracelſus* writes to this purpoſe in his Book called *Vexatio Alchymiſtarum*, where you'l meet with what will ſatisfie you in this matter. Conſider well of what I have ſaid, and thou wilt find more than I dare ſet down; for it is no ſmall or common thing to obtain the pure Souls of Compact Metals, without any foregoing Solution of their Bodies.

N. B. Thoſe Metals which are molten with Minerals, being filed, and proceeding with them as aforeſaid, afford a Spirit higher in colour, and of a ſtronger ſmell than ſimple Metals. Take an inſtance from Braſs, of which if you lay a piece upon a red-hot Coal, it will ſend forth a bad ſtench, or put Coals into a Braſs Chafing-Diſh, and you'l perceive the ſame; which bad ſmell proceeds from the *Lapis Calaminaris* which is joyned with the Copper, the ſaid *Lapis Calaminaris* being a volatile and ſtinking Mineral. So likewiſe when ♀ is made white by the addition of Arſenick, it ſtinks much worſe than when it is join'd with *Lapis Calaminaris*, as being much more poiſonful. This ſtinking fume which proceeds from Braſs, though it

be

be a Spirit, yet is not without a Body, and may be called a ſpiritual Body, or Bodily Spirit. Theſe fumes are hurtful to the Brain and Heart; and therefore a wiſe Man endeavours to catch this Volatile Spirit, and to turn it to a true fixt Tincture, fixing white Metals into a permanent Yellow; as the ſtinking fume of White ♄, made ſo by *Arſenick*, may be reduced to a Tincture, which will tinge Red ♀ into White.

I have ſaid enough here, he that hath ears to hear, let him hear. He, who deſires to know more concerning thoſe *Metallick* Odours, may read *Braceſcus*; where he will find, that from them the Philoſophers Stone, or higheſt Medicine againſt all Diſeaſes of Men, and Metals may be prepared: Of which, elſewhere I may have occaſion to treat further.

It remains now to diſcover, in what manner the Medicinal tinging Spirits, or Souls of Stones, are to be extracted, wherewith great Honour and Riches may be obtained in the Practice of Phyſick. The Proceſs is the very ſame, as with the *Marcaſites*; for when white Pebbles and Chryſtals, or colour'd Stones, as *Jaſper* Stones, *Lapis Lazuli* and the like, being firſt made red hot, have our *Alcohol Vini* poured upon them in a convenient Diſtillatory, the Spirit of Wine carries over their ſeveral Colours, which Tinctures are of great uſe in Phyſick. In this way, we may get a Spirit from Lime ſtones, which is moſt ſubtil, and ſtrong of any other whatſoever.

As for Corals and Pearls, they are not to be made red hot (becauſe their Virtue is deſtroyed by ſtrong Fire) but only heated, and pour Spirit of Wine upon them, by which means the Spirit of Wine will bring over the Eſſence of Corals of a curious red Colour, and that of Pearls white as Milk.

The Stones that are found in Fiſhes, Crabs eyes, ſo called, need only to be pulverized, without heating them, and in abſtracting the Spirit of Wine from them, we obtain all their Virtues; which Spirit of Wine being afterwards ſeparated there from, as I have taught, or according to my new invention burnt away, we ſhall get the true Magiſtery of theſe Stones, being a pleaſant *Salt*, full of Virtues, and without any thing of Corroſiveneſs. This *Salt* is the true Magiſtery of theſe Fiſh-ſtones. The like true Magiſteries may, without the aſſiſtance of any Corroſive, be prepared of Coral, Pearls, Mother of Pearl, Cockle-ſhells, and the Egg-ſhells of ſome particular Birds, as alſo of ſoft Stones, ſuch as *Lapis Lyncis*, *Judaicus*, *&c.* Let no Body think ſtrange, that I make mention here of Egg-ſhells, amongſt the reſt; ſeeing it is certain, that they have their Original from Stones, as Experience teacheth us, for when Hens are coop'd up in the Winter time, in places where they cannot meet with Sand, or ſmall Stones, they lay Eggs without ſhells. Wherefore Egg-ſhells are not to be contemned, for when according to my Inſtructions they are reduc'd to Magiſteries, they are of great uſe in curing the Stone and Gout: And are uſed with extraordinary Succeſs, to haſten the Birth in Women, ſtrengthning both Mother and Child, and helping to expel the After-Birth.

Swallows Egg-ſhells may eaſily be had, foraſmuch as after they have hatch'd their young, they caſt them out of their Neſts, and afford an excellent Medicine againſt the Falling Sickneſs. The Egg-ſhells of the Wag-tail would be yet more effectual to this purpoſe, if they could be got, for no Bird is ſubject to the Falling Sickneſs, but it: For being caught, and running about with other Birds in the Winter, it's oft ſeiz'd with the Falling Sickneſs, his Feet ſtagger, his Head and Tail tremble, and at laſt falls on his Back, but continues not ſo long, for riſing again, he plucks out ſome of his Feathers, and thereupon immediately recovers, and runs about, eats and drinks as before: Of whoſe Feathers, ſince their Egg-ſhells are not to be got, a Magiſtery may be prepared againſt that Diſtemper.

They who know, that great Virtues are contained even in natural ſuperfluities, will not wonder at my treating here of Egg-ſhells and Feathers. Some great Philoſophers have ſet down the way of making the Philoſophers Stone of them; amongſt the reſt, a certain Author, writing concerning Mans hair and Egg-ſhells, concludes thus: *Though theſe matters may ſeem to be very ſtrange and abſurd, yet who is there that knows all things*, &c?

Many other Subjects might be hinted, from whence Magiſteries may be prepared, but I think it needleſs, he who ſets upon the work will eaſily find many more, than I have mentioned. I ſhall only, by the way, take notice, that the common Magiſteries of the *Apothecaries* Shops, are no Magiſteries, but mere dead, unprofitable Powders.

We now proceed to the Preparation of Vegetables and Animals, which being of different Natures, muſt alſo differently be prepared. As for Inſtance, *Opium* (which is a tough Juice, and cannot be pulverized) muſt be cut in thin ſlices, and laid on a Tin Plate before the Fire, or any other convenient way, to be dried, and then powdred; which done, we muſt pour upon it ſome of our *Alcohol* of Wine, and after a ſhort digeſtion diſtil it, by which means we ſhall get it's moſt ſubtil Eſſence; and, if afterwards we burn away the Spirit of Wine, part of this Eſſence will aſcend with the *Mercurial* Water, and other part ſtay behind. The former of theſe, *viz.* the Volatile *Mercury* of *Opium* is ſo powerful, that when only ſmelt to, it is of better effect than the common *Laudanum Opiatum* taken in ſubſtance. The Red Liquor, which remains behind in the Cup or Diſh after the Spirit of Wine is burnt away, may be taken inwardly. That which remains in the Glaſs Body after Diſtillation is of no great uſe, and may be caſt away; yet if any one will take the pains to diſſolve it in common ▽, filter, and after reduce it to the conſiſtence of Pills, perhaps he will not find it much inferior to the common *Laudanum Opiatum.* The Oyl which remains in the Cup is of very excellent Virtue, as having paſt the Purgatory Fire of the Spirit of Wine, whereby it is much corrected: Wherefore alſo we find, that this Oyl is wholly deveſted of that loathſome Smell that is in *Opium.* But yet the *Mercurial* Virtue, which aſcends together with the Flame, is far better than that which ſtays behind, not only in Virtue, but becauſe being in the form of a clear ▽ without Taſte or Smell, it may with the more eaſe be taken by the Sick. The ſaid Oyl may alſo with Saffron, and the Narcotick ♆ of the *Vitriol* of ♀ be thickned and reduced to the Conſiſtence of Pills.

This Medicine is of great uſe, for ſuch as are in pain, and want their due Reſt, removing the one, and procuring the other: And no Body can be ignorant, how neceſſary Sleep and Abſtinence are, to preſerve Health, as well as to remove Diſeaſes.

According to this way, we may extract the Virtues of all vegetable Subjects, and greatly exalt, as well as correct them, where need is.

N. B. Henbane and *Tobacco*, this way prepared, afford *Narcoticks* not inferior to *Opium. Aloes*, *Myrrh*, and *Saffron* handled in this manner, make an Elixir *Pro-*

prietatis, ten times better than that described by *Paracelsus*, or *Helmont*: For our *Alcohol Vini* brings over only their purest Essence, which is afterwards yet further exalted through the Flames of the Spirit of Wine. According to this method, a Man may prepare from Vegetables excellent Cordials, *Cephalicks*, strengtheners of the Stomach, *Nephriticks*, *&c.* which in their effects will far exceed the Common. Only we are to observe; that when we have a mind to prepare an universal Medicine, we need not to meddle with Vegetables or Animals, which are Grandfather *Demogorgons* green Cloak, forasmuch as a little piece of his Heart, is far more valuable than his whole Cloak; wherefore he that would prepare an universal Medicine, of greater Virtues than all Vegetables and Animals contain, let him take to Task a part of this *Demogorgons* Heart. Concerning which, if the Reader desire further to be satisfied, let him peruse a Treatise of the incomparable Philosopher *Joannes Bracescus, of the Tree of Life*; where he may be informed, who this *Demogorgon* is, what his clothes, and what the inmost Blood of his Heart are.

Now by the way, to speak a little of this *Demogorgon*, we are to understand, that the Ancients always described their universal Work, not plainly so, as to be apprehended by every one, but wrapt up in Riddles and Allegories; all of them pointing to this *Demogorgon*, who has his Seat in the Center of the Earth, having a rusty Colour'd, and green Cloak cast about him; which in plain terms, is nothing else but the Central Fire, which God, when he created the World, placed there as an everlasting vivifyng Fire; by means of which quickening Fire, not only Metals and Minerals are produced, but also all Herbs, Plants and Trees: Upon which Account, the ancient Philosophers have described this *Demogorgon*, to be the Grandfather of all the Heathen Gods, that is *Metallick* Subjects, and an Upholder of, and Provider for all things that are within, as well as without the Earth; for all things proceed from one Original, *viz*, this *Demogorgon*. Concerning which, *See the Twelfth Treatise of* Sendivogius.

Metals and Minerals, are as it were the Shirt, or inmost covering of *Demogorgon*, whereas Vegetables and Animals, are but his Cloak, or upper Garment. The Ancients have writ much concerning this *Demogorgon*, attributing to him, not only the Generation and growth of Stones and Metals, but declaring him to be the Father of those living Spirits, which are often found in the Mountains, where Mines are, especially of ☉ or ☽, about which, if the Reader desire to be further satisfied, let him read George Agricola *his Treatise concerning Subterraneous living Creatures.*

To return then to our *Demogorgon*, I say, there are found some contemptible Minerals, in which all the Virtues of Vegetables and Animals lye concentred, which Minerals take their Original from the purest Heart-blood of *Demogorgon*: Such Minerals as these we are to take in hand, if we would prepare an universal Medicine against all Diseases, as well as a Tincture, to meliorate all white Metals with great Gain and Profit. We are also to observe, that such an universal Medicine, may easily, with little Charges, and in few days, be prepared: For the Minerals themselves cost little or nothing, the Dissolvent is very cheap, and the burning Spirit is not Chargeable, so that an Universal Medicine, to meliorate Vegetables, Animals and Minerals, may be made with the Charge of an Angel; which, certainly, is a strange and wonderful *Compendium.* All this may be done with the help of our Spirit of Wine *Alcolisatus*, without which, the Essence of these Minerals cannot be brought over, nor be made perfectly sweet and fine, without enduring the Purgatory of its refining Flames: Wherefore, also our *Elias Artista*, or *Salt* of Art, wherewith we acuate our burning Spirit, and make such a wonderful *Menstruum* of it, may well be called the Monarch of *Salts.* And to demonstrate, that such a Medicine prepared of Metals or Animals, with the help of our *Salt* of Art joyned with Spirit of Wine, is not only able to cure all the the Diseases of Men and Metals, but also of Vegetables, appears first from hence, that an universal Medicine can scarcely, or at all be prepared without the Concurrence of Vegetables and Animals: For which reason the Philosophers say, that their Stone is Vegetable, Animal and Mineral; if then the universal Medicine be made up of these three, we must conclude also, that it is Master and Commander over them. The use of this Medicine in the several three Kingdoms, is as follows. When by means of our *Tartarized* Spirit of Wine, thou hast brought over the pure Essence of a Metal or Mineral, and separated the Spirit of Wine from the *Metallick* Essence, by burning it away, then the said Essence stays behind in the Cup or Dish, wherein the Spirit of Wine was burnt away, and may without any other Preparation be made use of, for the Cure of all curable Diseases. But when we have a mind to make use of this Essence, for the meliorating of Metals, we must first ferment it with common ☉ or ☽, for without this, the Soul or Quintessence of Metals can have no ingress into Metals, so as to unite with them in a Fire of Fusion. We are also to note, that when this *Metallick* Essence is fermented with *Sol*, it becomes a *Solar* Tincture, but when with ☽, it only affords a white Tincture. It is also to be observed, that when we take two parts of ☉, and one of ☽ for our ferment, we shall have a Red Tincture, and so on the contrary, if we make use of two or three parts of ☽, to one of ☉, it will only be a white Tincture, because the predominant Metal determines the Tincture. But he who hath once obtained a well prepared Quintessence of Metals, will easily know the ferment and way of applying it, for a due application is of great moment in this matter. I have known some, who had extracted good Tinctures from ♂ and ♄, but understood not the way of fermenting them, that is of joyning their ferment without their Tinctures; neither did they understand the Inceration, that is, the way to give to your Tinctures easie Fluxibility and Ingress, so could not arrive at their desired End. Were the World worthy of it, I could set down an easie, cheap and short way, to extract much ☉ out of ♀, by which means every one that is somewhat skilled in Distilling, Melting and Cupelling, might have a Rich and inexhausted Mine in his own House, but it is much better to be silent, than to strengthen Men in their Pride and wickedness.

But to return to the Medicinal use of our Tinctures, we are to take Notice, that the Red Oyl, which remains after the burning away of the Spirit of Wine in the Cup, is fittest to make a *Metallick* Tincture of: But the ☿ or Celestial *Vitriol*, which mounts with the Flame of the Spirit of Wine, is the most proper Medicine for human Bodies: For this pure *Mercurial* ▽ is the true and best ▽ of Life, wherewith, not alone Men, but also other Animals, yea and Vegetables too, may be cured of all Diseases, and Evils incident to them. And forasmuch, as the highest Medicine of Vegetables is the Nourishment they draw from the Earth,

Earth, the warmth of the Sun, and fruitful Rain, and that on the contrary a dry and barren Soil, and want of the cheriſhing heat of the Sun and Rain, are the Death of all Vegetables, it is apparent, that there can be no better Remedy to keep off the Death of Vegetables, than this our ſweet cheriſhing, and vivifying ▽ of Life, or Celeſtial *Salt*: For when any Seeds of Vegetables are ſteeped therein, and ſet only in Sand, they immediately ſhoot up and grow: And having this effect upon Vegetables, we have the leſs reaſon to doubt of its cheriſhing, and vivifying Virtue on human Bodies, as indeed there cannot be a better Medicine to rid the Body of Man, of all manner of Diſeaſes than this Univerſal Bleſſed ▽ of Life, or heavenly Rain ▽. When we attentively conſider Nature, we find, that the Life and growth of all Vegetables, Animals and Minerals, is Originally from the Air, or an Airy volatile Spirit. Thus we can make all hard Stones and Metals grow as it were in a moment, by means of ſuch a volatile Spirit, concerning which, I have ſpoken in the Second Part of my Furnaces.

This ſudden growth of Stones and Metals, I have many years ſince ſhewed to ſome of my Friends, who greatly admired the ſame, but could not comprehend that reaſon thereof. Now therefore, to ſatisfie the Searchers after truth, I declare, that all growth, whether in the *Microcoſme*, or *Macrocoſme* proceeds from a Spirit, or Volatile *Salt*, ariſing from two contraries, *viz.* an *Acid* and an *Alkali*; for when an *Alkali*, and an *Acid* Spirit meet, they cauſe an Effervеſcence, during which, there proceeds from them both a very ſubtil Spirit, which has the Nature and Property to make all things grow. If a Man takes this Spirit inwardly; it procures and preſerves health; if it be joyn'd to an Herb, it makes it to grow and ſhoot up ſuddenly. With this Spirit we can make an Herb grow from its Seed in the midſt of Winter, (but it muſt be in a warm Room,) ſo as it may be ſeen to grow; which my ſelf have performed more than once. And to make it appear, that this ſwift growth only proceeds from a volatile Spirit, produc'd by the ſtrife of two contraries, I'le give this inſtance; pour one Pound of Oyl of *Vitriol*, upon one or two Pound of calcined *Tartar*, not at once, but by degrees, and at ſeveral times, and it will cauſe a great ſtrife and Effervеſcence, cover the *Cucurbit* with its Head, and give Fire in a Sand Furnace, by which means a very ſubtil volatile Spirit comes into the Receiver. If before this Work be undertaken, a Stone hath been diſſolved by the calcined *Tartar*, and a Metal in the Oyl of *Vitriol*, then the Spirit, which proceeds from them, will be much more powerful; becauſe the Virtue both of the Stone and Metal comes over with the Spirit. In this manner may a volatile Spirit be had from all *Acids* and *Alkalis*.

To demonſtrate this further, that the growth of all things proceeds from the ſtrife of two contraries, take this inſtance: Diſſolve ſome Iron or Copper in Spirit of *Salt*, or Oyl of *Vitriol*, draw off the Flegm, in which Diſtillation none of the *Acid* Spirit will come over; becauſe it is joyn'd and concentred with the Metal, animating and diſpoſing it to ſhoot up and to grow ſwiftly, ſo as the eye may perceive it grow, like a Tree with a Body, Boughs, Branches, and Twigs. Take this Spirit of *Salt* or *Vitriol*, concentred by the ♂, as ſoon as you have taken it out of the Furnace, whilſt it is yet warm, and break it into little Bitts, about the bigneſs of large Peaſe (if you ſhould ſuffer it to grow cold, it would by attracting the Air, ſuddenly run into an Oyl *per deliquium*.) Theſe pieces of animated ♂, muſt be joyned with its contrary, for which you can chooſe nothing better than a Liquor of Flints prepared in the ſame manner, which I have taught in the ſecond part of my Furnaces. The Glaſs, wherein you put this Liquor of Flints, muſt be of the ſame wideneſs at the top, as at the bottom, and about an hand-breadth high, and fill'd with the ſaid *Alkalious* Liquor, to which, put your *Acid* concentred by the ♂, laying the pieces orderly a thumbs breadth from one another, and place the Glaſs, where it may not be ſhaken or jogg'd. As ſoon as theſe contraries are thus joyned, they begin to act upon one another; but foraſmuch, as the one of theſe contraries is concentred by the ♂, and become hard, it cannot mingle it ſelf with its adverſary, or deſtroy it, ſo they only vex and anguiſh one another, in doing which, a warmth ariſeth between them, and the one contrary puſheth the other to ſhoot and grow; the hard and dry part, *viz.* the animated ♂ drawing ſo much moiſture from its contrary, the Liquor of Flints, as makes it heave and begin to grow in form of a Plant, with Root, Stock, Branches, and Twigs, very pleaſant to behold, the growth being very ſwift, ſo as within an hour and an half, or two hours at the moſt, the whole Glaſs is fill'd with little iron Trees, which grow harder and harder, and when they are hard enough, (which will be in the ſpace of twenty four hours) then the Liquor of Flints muſt be let out from it through a hole, left on purpoſe in the bottom of the Glaſs, and the Plant, or little Tree, remains. If we deſire to make a more pleaſant ſight of it, we may take ſeveral Metals, and make them grow up like a Tree; ♂ affords a dark brown, *Venus* a green, ♄ ♃ and ☿ a White and Grey, ☽ a Blew, and ☉ a Yellow Colour. Minerals alſo give different Colours from Metals; *Lapis Calaminaris* grows not into Trees, but into the reſemblance of Mountains and Rocks of a White and Greyiſh Colour.

If we have a mind to make Stones to grow, we proceed thus, firſt we melt the Stone, whether White or Coloured, into a tranſparent Glaſs, and pour it forth into a Copper Baſon, where it will flow broad and thin, and will be the fitter to be broke into as ſmall pieces as we deſire. Which peices we place as before in a flat bottom'd Glaſs before deſcribed, which muſt be full of an *Acid* Spirit mixed with water, ſo as it may neither be too ſharp, nor too weak; for if it be weakned with too much water, it will not retain ſtrength enough to make it grow; and if the *Acid* be too ſharp, it will diſſolve the *Alkalized* Stone, wherefore great care muſt be taken, as to this particular.

N. B. The *Magneſia* gives a Blood-red Tree, and much more beautiful than any of the Metals: Only obſerve, that Metals may be made to grow with leſs trouble than Stones.

From what hath been ſaid, it appears beyond diſpute, that the growth of Vegetables, Animals and Minerals (Stones not excepted) proceeds from two contraries. I could eaſily make this out more amply and fully, but having treated of the ſame in other parts of my Writings, I ſhall let it reſt here.

An

An Appendix or COROLLARY.

I Have in the foregoing Treatiſe declared the uſe of the *Salt* of Art, both in Phyſick and Alchimy, and have ſet down nothing, but what my ſelf have experienced. What I have writ concerning our *Alcolized* Spirit of Wine, is alſo the very truth: And tho' what I have here ſet down might ſeem to ſuffice; yet I cannot, before I conclude this ſmall Book, but mention a much greater Gift of God, than that of which I have ſpoken here, *viz.* that God hath vouchſafed Mankind, for preſerving their Health, a Subject, wherein the Powers and Virtues of all Vegetables, Animals and Minerals, are ſumm'd up and united together; which Subject may be had in all places for nothing, and however contemptible it may ſeem to the ignorant, yet it is the matter of the higheſt Medicine in the World. Every Man can have enough of it from himſelf, needs therefore not to go to another for it. *Adam* and *Eve* our firſt Parents brought this matter with them out of Paradiſe; yea, every one brings it along with him from his Mothers womb.

Let no Man imagin, that I ſpeak here of Urine, or Mans Dung, it is ſomething elſe, and more deſpiſed than either of them, ſo that a proud Man will ſcarcely light upon it. I ſay, if a Man know this Subject, and how to make uſe of it in Phyſick, he may well account himſelf happy, as needing nothing of all that is in the World beſides, in Caſe he hath only ſtrength, place, and convenience to prepare the ſame. The Subject coſts nothing, and the Preparation requires neither Glaſſes, Coals nor Furnace. I commend this Subject to Phyſicians above any other in the World, the Preparation being eaſie, and without Charges, and may be finiſhed in few days: So that the knowledge of this Subject, and its eaſie Preparation, ought not to be look'd upon, as an invention of Man, but as a wonderful, and undeſerved Gift of God, reſerved only for thoſe, who deſpiſe the World with all its Vanities, renounce the Devil and all his Works, and avoid the Company of wicked Men, his adherents.

Of the Three moſt noble STONES generated by Three Secret FIRES.

AND

Firſt, Of the Stone of Philoſophers, which is prepared by the Secret Fire of the Wiſe.

Secondly, of the upper and lower Thunder-ſtone, how they are generated above, by the Meteorological Fire; and below, by the ſecret Artificial Fre. And,

Thirdly, How the Lapis Ignis, *or Fire-ſtone of* Baſilius, *is to be prepared out of* Antimony *by Art.*

And how thoſe Three moſt noble Stones of the World, are to be uſed in Phyſick and Alchymy. Tranſlated out of the High-Dutch

Reader,

IN the end of the Appendix to the Seventh Part of my *Pharmacopœa Spagyrica*, I have made mention of Three Fires, which are not Common, but unknown to the World. By which are generated three wonderful Stones, which I did intend to publiſh. Firſt, of the ſecret Fire of Philoſophers, commonly called the Fire of *Artephius*, becauſe *Artephius* a very ancient Philoſopher did firſt write of it, who was alſo envious like others, and would write nothing of it, till he came to be nine hundred Years old, which way the Philoſophers Stone was to be made by this Fire. Theſe Writings have been long toſſed up and down the World, before any could be certain, whether or no this miraculous Fire could be found in Nature. At length ſome Philoſophers attain'd its knowledge, and pnbliſhed it for the good of the World. But becauſe, thoſe Philoſophers were very obſcure in their Writings, the Art could not be made common, but remaineth ſecret to this hour: So that one of a Thouſand among the now reputed Philoſophers, (who have fill'd the whole World with their unexperienced Writings) ſcarcely one is to be found, who know any thing of it. And becauſe this ſecret Fire was called by the true Philoſophers, *Ignis Philoſophorum*, it would have becomed them, to know ſomewhat of it. *Helmont* the moſt experienced and learned Philoſopher of his time, although he had ſtudied long in the Univerſities, yet he doth not Glory in any Arts he there learned: But on the contrary, he ſaith, that Phyſick, as it is taught in the Schools,

is

is of no value. And, that not the Universities, but the Fire, made him a Philosopher. And therefore, he calls himself a Philosopher by the Fire. And without doubt, our secret Fire was known to him, as appears by his excellent Writings. For his *Elementum Ignis Veneris*, to which he attributes so many Virtues, could not well be made, without this secret Fire. A Quintessence may be drawn out of *Venus*, but that will not effect, what the Red Element of the incombustible *Sulphur* can. *Paracelsus*, in his Book of *Sulphur*, writes, that an excellent *Elementum Ignis* may be made out of common *Sulphur*, which he so highly commends, that he dares to say, that except a Physician hath this Element of Fire, (that is the fixed Quintessence of *Sulphur*, among his *Arcanums*, he cannot rightly be reputed a Physician, but a Money Catcher, and Robber of the Sick. In my lately published Treatise of *Sulphur*, I have also described an *Elementum Ignis*, which is certainly a very excellent Medicine against all Cold Distempers, but this is not yet fixed, but combustible, but the Element of Fire ought to be incombustible. For as long as a Medicine made out of *Sulphur* is still combustible, and subject to blacken Silver when touched with it, it cannot be reputed the true *Elementum Ignis Sulphuris*. For the true Element of Fire of *Sulphur* doth not make Silver black, but tingeth it with a constant Golden Colour, which cannot be washed off. As also, the Element of Fire ought to be of this Nature, to enter a Red hot Plate of Silver without fume, as Oyl sinks into dry Leather; and to tinge it Yellow. Also, it ought to tinge common ☿ into Gold, when added to it in a due heat. This Quintessence of *Sulphur*, also must not be burnt by the Fire as other Oyl, but remain incombustible. Therefore, the Philosophers have called it an incombustible Oyl, a permanent Water, *Aurum potabile*, *&c.* When it hath those Virtues, then it can perform what *Paracelsus* attributes to it, *viz.* Wonders both in Physick and Alchymy; and by this, *Aristotle* and his followers (who assert, that the Species of Metals cannot be transmuted) are quite out of Doors.

It is true, *Aristotle* also saith, that the Metals cannot be transmuted, if they be not first reduced to their first matter, of which I have sufficiently treated. This our fixed Oyl of *Sulphur* transmutes the Metals without any precedent reduction of them to their first matter. For our secret Fire hath taken away whatsoever was pernicious or combustible; so that only the purest and incombustible part remains, by which such great things in Medicine and Alchymy are performed, that it refuteth all those who speak against it; although many Impostors by their cheats, from place to place, have given occasion to speak evil of the Noblest of Arts; which hath had an ill effect heretofore upon my self.

An History of the Poisonous Tayl of Common Alchymy.

Here follows a large Historical Digression of some great Abuses which the Author some time underwent, but pertaining nothing to the scope of this Treatise, I will not trouble the Reader with it.

Now concerning our secret Fire, it is not made of Coals or Wood, or other combustible Matter, but compounded of certain Fiery Waters, which burn, but not like other Fires without the Glass, but always within the Glass; wherefore *Artephius*, as the first Author of the secret Fire, useth these words. *Our Fire is Mineral, Equal, Continual, it Vapours not unless it be too much stirred up, it partakes of* Sulphur, *and is taken elsewhere than from the matter; it pulleth down all things, dissolveth, congealeth, and calcineth, it is artificial to find; it is a short way without cost, at the least with small cost; it is moist, vaprous, digestive, altering, piercing, subtile, Airy, not violent, not burning, compassing or environning, containing but one, and it is the fountain of living Water which goeth about and containeth the place, where the King and Queen bath themselves.*

This is *Artephius*'s Description of the Fire of Philosophers. *Pontanus* hath also wrote of this Fire, to whose Epistle I refer the Reader for the more easie introduction to it.

Artephius hath here plainly enough described the Matter, and the *Mercurial* Water, and *Pontanus* hath confirmed it. He to whom God will give it, will easily comprehend it; but *Artephius* and *Pontanus* teach nothing, but how to ripen the Stone of Philosophers compounded of Gold, Silver, and *Antimony*, by this secret Fire. But because several others as well universal as particular are to be easily prepared by this our Fire, I think fit to say somewhat of it. Our Fire maturates whatsoever is put to it, whether Vegetables, Animals, or Minerals, and therefore our Fire, as also the Matter of the Philosophers Stone it self, is called Vegetable, Animal, and Mineral; as also a natutural, non-natural, and supernatural Fire. He who is not satisfied with this may read *Artephius* himself, where he will find more of this our secret Fire.

Now having understood what *Artephius* and *Pontanus* have written of our secret Fire, I could not but describe it somewhat more openly, to shew the Artist a nearer and easier way to obtain it. I *Glauber* can truly affirm this, That in my young days I have travelled many Countries, and diligently searched for an Experienced Philosopher, that might teach me some good. But I no where found my desire, but I often found some diligent Physician, who following *Crollius*, *Hartman*, *Beguinus*, and other Experienced Physicians, prepared their own Medicines, by which they gained Honour and Wealth, and were therewith content. Some of them had indeed read *Artephius* and *Pontanus*, but had not light enough to understand them. I have also endeavoured to frequent the elaboratories of Princes, to learn something there. Indeed I found Processes enough there, which were sent from great Men. By following of which, and working in *Arsenick*, *Orpiment*, *Cobolt*, *Cinabar*, *Mercury* and the like Minerals, I drew a great deal of Poison into my Body, till at length I grew weary of it, and therefore set my mind upon *Spagyrick* Medicines, by which I have found many curious Secrets, and gain'd a sufficient Livelyhood. But yet at the same time, I attentively read the Writings of the Philosophers, and out of them learned many good things, chiefly *Basilius*, *Bracescus*, *Neusementius*, and the like good Authors; but the secret Fire of *Artephius*, or the proper Agent, I could not Learn, I have often Discoursed of it with Learned men, but always found, that they understood less of it than my self. For they had not read the Ancient Philosophers, but had spent their time in getting of Money, and sending their Receipts to the Apothecareis Shops. But after a light was enkindled in me from above, and I began to know this secret Fire, I began to have an aversion to the tedious, and troublesome work with Glasses, therefore I set it all aside, and now find my self more at ease, by this Capital work, for I make no further use of Furnaces, Glasses, or Coals, but can now do

more and greater things in half a Nutſhell or Egg-ſhell, than I could before, with all my Furnaces, Glaſſes and Coals, for which I give inceſſant thanks to God, who is the giver of all Good. This I was willing to add, *viz.* that our Fire is hard to be found, but eaſie to be made, when known. Concerning the Matter, it is not always the ſame, but may be taken after ſeveral ways, yet according to the true proportion of the Fire, for this is all in all, the proper Agent muſt be only excited by our Fire, and carried on to the promoting of the Maturation of our Matter; for the proper Agent is here as much concerned, as the fire it ſelf, for that alone could not work ſufficiently to prepare an unripe Mineral by it ſelf, without the help of the proper Agent, in ſo ſhort a time, into a Tincture conſtant in the Fire, or univerſal Medicine. Now whoever hath a mind to do any thing with our ſecret Fire, muſt have conſtancy of mind, tarry at home, and beg aſſiſtance of God, whoſe Bleſſing he muſt wait for with Patience.

Now concerning the farther uſe of our ſecret Fire, it is thus, that all Vegetables, as Herbs, Roots, Seeds, Woods, *&c.* and all Animals, none excepted, together with all Minerals and Metals, may without Coſt, be eaſily brought into excellent Medicaments, particularly. For our Fire *Maturates* the pureſt *Anima*, or Quint-eſſence of all things. Poyſonous Subjects are converted into Medicine, ſowr and bitter into pleaſant and ſweet. The immature is ripened; and our Fire can be better compared with nothing, than with the Sun, which gives Life to all Vegetables, Animals, and Minerals, and makes the imperfect, perfect, nothing excepted. In fine, Our Fire is the greateſt and moſt noble in the World, the Sun excepted: But God is above all, the Lord of the Creation. But what need I ſay much of the Melioration of Vegetables, Animals and Minerals, by our ſecret Fire, I have ſaid enough, if I ſhould ſay more, it would render it too Common.

But thus much it will be neceſſary to add, *viz.* what the Subjects are, which are the moſt eaſily wrought upon by our Fire. Among Vegetables, Wine, and what pertains to it is the beſt; Among Minerals, *Antimony* and *Mercury*, which is our living Gold; Among Animals, Man, and what appertains to him. You have your own choice to chuſe, which you will, you have ſufficient Advice, and want nothing more, but the Bleſſing of God, without which all is in vain.

Here followeth the Compoſition, or Preparation of our ſecret Fire.

Three Heatheniſh Deities command this our ſecret Fire, *viz.* *Apollo*, *Diana* and *Pluto*. *Apollo* affords the warm Sun-ſhine. *Diana* gives the cooling and refreſhing Night. And *Pluto* gives his Fiery Helliſh Rain. That you may better underſtand it, *Apollo* gives Wine three times, *Diana* Milk twice, and *Pluto* his Helliſh Fire once. Out of theſe three Gifts, our Fire is prepared. This is the true Preparation of our wonderful Fire. To ſpeak of this more amply, is not convenient; we muſt not caſt Pears before Swine, which way this Fire is to be uſed to any Subject, is ſufficiently diſcovered to a Man thereunto elected by God. But there are many, who having no dependency upon God's Bleſſing, proceed after an evil and cheating manner, ſo that thoſe *Alchymiſts*, or Gold-makers, are become a ſcorn to the Country, and no Man cares to dwell by them, leſt their great and continual Fires ſhould bring damage to his Neighbours, and this not without reaſon. For in making Oyl of *Vitriol* after the common way, a Fire is kept ordinarily for forty or fifty hours, which is a very tedious Work; but the Adepts can force over a Pound of Oyl of *Vitriol* in an hours time, with very few Coals, which thing I have already touched in my Writings, and ſhall ſay more of it in my Second Appendix. I have recommended this compendious way of making Oyl of *Vitriol* and *Sulphur*, to ſome Men; but they adhered ſo cloſe to their old lingring way, that they were regardleſs of a better, notwithſtanding that the Oyl of *Vitriol*, and the *Acidum* of *Sulphur*, are the Baſis or Foundation of all the common *Hermetick* Medicine, for all other Mineral Spirits are by them acquired eaſily and plentifully. That Mineral *Acid* which is plentifully found in *Vitriol* and *Sulphur*, is the only Agent whereby Nature *Maturates* the yet volatile and unripe Minerals in the Earth. And alſo all Tinctures, which are fixed and conſtant in the Fire, are by the hand of the *Artiſt* prepared by this, yet with the Addition of its Compeer, the external Fire. This univerſal *Acidum* is our Horſe-dung, and the *Stygian* water, in which *Jaſon* drowned his Dragon and made him fixed: But when I here mention *Jaſon*'s Dragon, it comes into my mind what happened to me, when I once attempted to make ſuch a Dragon, which vomited out Fire, and a black poyſonous Smoke, out of *Sulphur* and *Salt-peter*: And becauſe this Hiſtory, may ſerve as a warning to many, who may incur much danger oftentimes by the common *Alchymy*, I will here inſert it. A little before I became Bed-ridden, I had undertaken to ſteal from the ever watchful Dragon, that Golden *Fleece* which he hath in his keeping, and becauſe this fierce Dragon will part with nothing before he be half ſlain, or at leaſt, laid to ſleep, therefore I was buſied in this work, and had made a mixture of *Sulphur*, *Niter* and *Tartar*, and alſo another of *Salter-peter*, *Antimony* and *Tartar*, each apart in an Earthen Pot, in order to Fire them for Detonation. And although I had ordered, that one Pot ſhould firſt be detonated, and then the other, that the Smoke might not be too great, yet this was not done, but they were fired both together, which cauſed ſuch a great, black and ſtinking Smoke to aſcend the Chimney, that when the Neighbours ſaw it, they thought the Houſe had been on fire, and cryed out, Fire, knocked at my Door, to come in to quench it, when there was none, notwithſtanding this was not done in my dwelling Houſe, but in a Houſe remote from all others, ſo that it could have done no hurt to any elſe, if it had been burnt down, but they not being ſatisfied got Ladders and looked down the Chimney, and ſeeing no Fire there, they then ſaid, it was Witchcraft. Out of this Hiſtory, one may ſee what a dangerous Toyl the common *Alchymy* hath. This work to kill the Dragoon, and to ſpoyl him of his Golden *Fleece*, is one of the pleaſanteſt that ever I did in *Alchymy*, except the ſecret Fire. For when the *Sulphur*, *Salt-peter*, *Antimony* and *Tartar*, are denotated together, and ſublimed with *Sal Armoniack*, the Golden *Fleece* riſeth in a curious Golden Colour, and tingeth the Head, and Receiver with all ſorts of Colours, like unto the Rain-bow, or a Peacocks Tail, and alſo one ſees the Foot-ſteps of the ſcaly Dragon moſt gloriouſly in the Head; which *Neuſementius* hath excellently deſcribed, in a few *French* Verſes. and hath omitted almoſt nothing which belongs to this Work: And becauſe I here write of this ſort of Work, it will not be amiſs, to add thoſe Verſes. Concerning this, *Medea* thus exhorts *Jaſon* in *Ovid*.

Pervigil

Pervigil ecce Draco, ſquamis crepitantibus horrens,
Sibilat & torto pectore verrit humum.

Which *Neuſementius* hath thus rendred into *French.*

Voy le Dragon veillant de fureur forcenè
Qui d'eſcaille bruyante a le corps entournè
Dont le goſier ſifflant fumeè & feu deſerre
Et qui par replis tors va baliant la terre
De ſa large poitrine en la poudre imprimant
Les ſinueux ſillons, qu'il trace inceſſament.

And may thus again be put into *Latine.*

Adſpice ſquamoſum tumidumq; furore Draconem
Semper in excubias aures frontemque minacem
Vibrantem, & nullo claudentem lumina ſomno
Qui criſta linguiſq; tribus præſignis, & uncis
Dentibus horrendis, patulo de gutture Flammas
Sibilat, & fumis atratis inficit auras.
Adſpice multiplices Gyros quos ponderè Caudæ
Inſinuat Terræ, cum longa volumina ducit
Perque ſuperficiem reptat, cum pectore lato
Verrit humum, relegens eadem veſtigia ſemper.

And in *Engliſh* may ſound thus,

Behold this ſcaly Dragon ſwel'd with Ire,
His Creſt doth brandiſh, with a dreadful Brow;
Nere cloſeth Eyes, nor Ears, nor yet retires
From diſmal noiſe, and horid Teeth to ſhew:
From his broad Throat flames iſſue out
Black fumes infect the Air about.
Behold the Rings, which his encircled Tail
Caſts on the Earth, whilſt he doth form his Coil;
With his broad Breaſt he creeps upon its Face
Sweeping the ground, always in the ſame Trace.

Here in few words the Philoſopher deſcribes the whole Work, how to ſpoyl the Dragon of his Golden *Fleece.* But only to thoſe, who eaſily underſtand theſe Verſes, whoſe eyes God hath opened, and are already pretty well skilled in this Art. But to the unexpert all remains dark. Reading only will not do it, but you muſt put your hand to the Work, if you will attain to any thing. I have, for ſeveral years together, read, ſought, and laboured in vain, before I found the right way of obtaining this Golden *Fleece.* And when at length I became Maſter of this Art, I could not but admire that it was ſo eaſie a thing, and yet ſo difficult to be learned out of Books. *Paracelſus* and *Neuſementius* write the plaineſt of this, of which two expert Men, I firſt learned this Art, but afterwards I found a more Compendious way, ſo that I can now perform the whole Work, with the Charge of one Ducat [or ten Shillings] in a very ſhort time. But I muſt leave it to others to do, being yet detained in my Bed by my ſickneſs: So that I can do no more, than to ſhew to others by my Writings and Inſtructions, the ready way to the Land of Promiſe.

Of the Second Fire, and its marvellous Fire-ſtone, which is generated by it.

We know, that Fire generates Stones, every one according to its Nature. The ſecret Fire of the Philoſophers, engenders the Philoſophers Stone, which is a univerſal Medicine for Men and Metals, as we have already heard. That the Meteorical fire, from whence proceeds Lightening and Thunder, generates alſo Stones, is known to all, for the Air procreates the ſame things, which are found upon the Earth. Therefore *Hermes* in his *Smaragdine* Table hath very well ſaid, That whatſoever is beneath is alſo above, and what is above, is alſo beneath, by which, marvellous things are done. We know, that Frogs and Graſhoppers and the like, which are procreated in the Air, have fallen down with the Rain. I have read in a certain Hiſtorian, that once a Calf fell down with the Rain.

Anaxagoras, a famous Philoſopher, prognoſticated in his Life-time, that after he was dead, a great Stone ſhould fall down from the Air, to the Earth, which alſo came to paſs. We alſo know, that ſometimes great pieces of Iron have fallen down, not compact, but ſticking one part to another like drops. And alſo, every Body knows, that Stones are caſt down by Thunder and Lightening, which Stones are formed and concentrated by the Lightening, and ſo have aſſumed the Nature of a Stone; for in the Lightening is hid a very miraculous Property; ſeeing that Lightening is a Fire of quite another Nature, than our common Fire, which breaks in pieces all hard things which reſiſt, but toucheth not what maketh no reſiſtance. It hath very often happened, that the Lightening hath broken a Mans Bones, without hurting his fleſh. We have alſo known, that it hath melted the Sword in the Scabbard, and left the Scabbard whole. This Stone generated by Lightening, hath quite another Nature than common Stones, for it is not tranſparent like a Pebble or Sand-ſtone, which melt in the Fire. Neither hath it the Nature of tranſparent and hard Gems, which do not melt in the fire, and yet keep their Luſtre, neither can the fire reduce it into Lime, as it doth a Chalk-ſtone. In a word, it can be compared with no Stone in the World. Its ſhape is alſo wonderful, for it is generally ſharp at both ends, but yet they are not all of one Figure or ſhape, they are generally ſmooth on the outſide, and of a milky Colour, and reddiſh within. I have one which is Triangular like a Star, and if you turn it, 'tis like a Heart, of which I never ſaw the like. I have alſo one which is Cole-black, which is rough both within and without, it is a wonder to me, that this Stone will not ſtrike fire with Steel, notwithſtanding it is generated by fire. We may alſo by Art make Lightening out of Iron or Steel, in which alſo is generated a ſtrange Stone. The Thunderbolts love all things which are combuſtible, eſpecially Gun-powder, for the Lightening it ſelf proceeds from *Saltpeter* and *Sulphur*, and that is the reaſon, why it ſo often ſtrikes into Towers, where Gun-powder is kept, and alſo it uſeth to ſtrike Old Oak Trees, which contain *Sulphur* and *Saltpeter*, alſo upon Church Steeples, but ſeldomer in the open Fields. I once ſaw in *Germany*, where the Thunder had ſtroke a Tower of Gun-powder, and although it was four ſquare, yet it run ſo about it, and took out a piece of Stone-work all round, as if it had been cut out with Tools, becauſe it could no where find entrance. Strange things are done by Lightning, it ſometimes killing the Horſe, and not hurting his Rider, and again killing the Rider, and not hurting the Horſe, becauſe it is no common Fire, but a concentrated Meteorical fire: It hath no reſemblance of the fire of the Sun, much leſs of our common Fire, but our ſecret Fire of the *Chaldeans* hath ſome Agreement with it, becauſe it is made of Iron or Steel, and *Saltpeter*: Therefore it cannot be much unlike the fire of Lightening, for that is alſo generated

generated out of *Saltpeter* concentrated, and *Sulphur*. Steel is concentrated *Sulphur*, that hath alſo Power to concentrate *Saltpeter*, and ſo to generate this marvellous Fire. The Meteorical Thunder-fire is a terrible one, but our Steel-fire *is* more wonderful in its Eſſence and Operation, as we ſhall heer by and by, for incredible things are wrought by it, ſo that even the Stone of Philoſophers, never ſo well prepared, is not to be compared with it. *Query*, whether this Thunderbolt which is caſt down by the Lightening be of any Virtue, or whether it be a dead and unprofitable Stone? I anſwer: It hath been always reputed, that if a Thunderbolt be kept in any houſe or place, the Thunder and Lightening will never ſtrike into it. Whether this be true, I cannot tell, yet this I know, that thoſe who keep them eſteem them highly, I my ſelf have one, which I much eſteem for its marvellous Figure, for turn it which way you will, it always repreſents a Star or a Heart. Many ſtrange things are performed by this Thunderbolt. I have ſeen ſeveral Foreſters break it into pieces of the bigneſs of a Pea, which they put into a Bullet-mold, fill'd up the Mold with melted Lead, and did believe, that they could not miſs any wild Beaſt at which they ſhould ſhoot it. I have alſo ſeen ſome Souldiers make ſuch Bullets, and formerly believed, that they could pierce any thing with them, that otherwiſe they could not ſhoot through. I have alſo ſeen others, who have put pieces of this Stone into the pummels of their Swords, and believed, that this took away their Adverſaries Courage when they ſhould encounter them, and ſo they might eaſily Conquer them. Theſe and the like things, I have ſeen done with it. But whether this be ſo or no, it is probable that there ſhould be ſome ocult Virtues in thoſe Stones. For ſeeing that all Stones are good for ſomewhat, why ſhould this marvellous Thunderbolt only be good for nothing? Some cauſe Women in Labour to hold theſe Stones in their hands, to facilitate their Labour; they alſo ſay, that it encreaſeth Womens milk, if it be put into their drink. Others put them into the hand to ſtop Blood. If one could do any good with it, one might eaſily, by the help of a certain Magnet, attract a great many of them from the Air, as you ſhall hear anon. Now again, to return to our Fire and Fire-ſtone, I affirm for truth, that our ſecret Fire and Fire-ſtone, in its Eſſence and Efficacy, is more wonderful than the Meteorick Lightning and Thunderbolt. For our Fire doth not burn or flame, but when we will have it, otherwiſe it is like a dead Black-ſtone, if you only keep the Air from it, it will remain a Stone as long as you pleaſe. If you put it into a Glaſs and ſtop it very cloſe, and keep it under water never ſo many years, it will ſtill remain Fire, and not be hurt. For our *Chaldaick* Fire, when once prepared, will not burn, but remain good for ever, if you keep it from Air and Water. It is ſufficiently known, that the ancient Heathens put burning Lamps into their Vaults, of which Lamps I have ſeen many, that were digged out of Mines in *Colen*. Some of theſe Lamps were found in ſome burying Vaults burning, when they were firſt opened, but as ſoon as the Air touched them went out. But our *Chaldaick* Fire remains dead, when kept cloſe, and is kindled by the Air. I call it dead, but it is rather a dormant Fire. This our ſecret Fire hath ſo ſtrange a Property, that it is able at all times to attract Fire out of the Air, not only in the hot Summer, but alſo in the cold Winter Nights, when the Sun is fartheſt off. By the help of this Fire, I believe, I could at certain times light a Candle, either under or above the Earth. The *Maccabees* ſet their Sacrifice on Fire by this, and not with common Wood, or Coal, fire, as the Veſtal Virgins in *Rome* were forced to feed it with Wood continually, that it might not go out; if by chance or neglect it went out, thoſe Virgins were buried alive; in ſo great eſteem, had the *Jews* and the Heathens, their Fires.

Now as for the uſe of our ſecret Fire, no Man may be ſo bold as to diſcover the Power thereof to the World, for things incredible are to be done by it, which are better to be concealed, than made publick: Yet I will a little touch at it. The ſecret Fire of it ſelf is of no uſe in Phyſick, but great Secrets may be prepared by it, both in Medicine and *Alchimy*. Firſt, out of our fiery Maſs may be driven a living *Mercury* of *Mars*, which is the moſt noble Subject to prepare an extenſive Tincture, both for Men and Metals, for of all *Mercuries* of Metals, this is the beſt. When our Fire is melted into a thick water, and this fiery water poured upon a ſubtil Calx of Gold, and digeſted with it, it will attract the yellow Colour from the Gold, and leave it white, yet the Tincture is not yellow, but as green as Graſs, out of which an excellent Medicine may be made; it is alſo profitable in *Alchimy*. For it is alſo of this Nature, that if you put a Solution of Gold and Silver into it, they will be joyned together without Ptecipitation, which is not uſual to be done. One may alſo ſquirt this fiery water, by peculiar Springs, to a great diſtance, and thereby fire any Combuſtible matter. If you will, you may alſo ſhoot this our Fire in a dry form, out of great and ſmall Guns, to fire any thing with it. I believe, that by the help of this, one might fire a great Canon under water, by which you may fright Fiſh up to the Surface of the water in deep Ponds, ſo that you may catch them with ſmall Nets. One may alſo drive away all hurtful wild Beaſts, as Bears, Wolves, Foxes, nay even Lyons, Tygers and Dragons, out of the Wilderneſs. One may alſo drive away High-way-Men, Murtherers out of their Ambuſcades, and catch them. In a word, many ſtrange things may be done with it, which for certain Reaſons I dare not mention. The greateſt and the beſt thing that may be done by this ſecret Fire, is the preparing of the *Mercury* of *Mars*, as alſo after a Magnetical manner to draw the Lightning which way one pleaſe. I have had this Fire now for above twenty years, and durſt not own that I had ſuch a thing, now I am near my end, I was willing to let it be known, that there is ſuch a Fire in Nature. If I did not fear, that malicious Men would abuſe this ſecret Wonder-fire, I would have been plainer, but the time is not yet come for the doing thoſe great things, but when *Elias* the *Artiſt* ſhall come, he will not fear to make great Alterations in the World, by the help of this Fire. He will eſtabliſh much good, and aboliſh all that is evil, but I have ſaid enough of this at this time. I have indeed told you here that it will be done, I do not deſire, neither ſhall I live till it ſhall come to paſs, for ſuch great Changes will not be made with eaſe, but with great Zeal. God preſerve the Pious, and ſhew them a way over the Mountains, where they may live ſecure from this *Sodomitiſh* Fire, *Amen*.

Of the Third ſecret Fire, and the wonderful Stone that is engendered by it.

That pious Philoſopher *Baſil Valentine*, in his Triumphant Chariot of *Antimony*, teacheth, how to prepare a Stone by Diſtillation and Rectification ou

o-

of the pureſt part of *Antimony*, and calls it the *Stone of Fire*, becauſe this Stone is prepared by Fire out of fiery Subjects: And alſo becauſe it expelleth all Diſeaſes from the Body of Man, and conſumeth them as common Fire doth Wood. He alſo ſaith, that this Fire-ſtone can tranſmute Silver into Gold, although in a ſmall quantity. The highly experienced Philoſopher *Helmont*, makes mention of almoſt ſuch a Stone, which he ſaith, he ſaw in *England* with one *Butler*, and tells of wonderful things that the ſaid *Butler* did with it. Now by reaſon of my diligent ſearch into Nature and the Bleſſing of God, ſuch a Stone hath fallen into my hands, with which I can do the ſame things in Phyſick and Alchimy, which *Baſil Valentine* aſcribes to his Fire-ſtone, and *Helmont* to *Butlers* Stone: I could not but leave to poſterity, that it is poſſible to prepare this Stone out of *Antimony*. The Art conſiſts in this, that you firſt bring the *Antimony* by Sublimation, Diſtillation and Rectification to the greateſt Subtilty, and afterwards again concentrate this ſubtil Spirit into a hard Stone, which Stone when it is not fixed (being then uſeful in Medicine) is of a reddiſh Colour, and eaſily melted, and penetrates all Bodies. But if by it you would graduate Silver into Gold, you muſt firſt fix it, to abide the *Cupel*, but being once fixed, it will not then perform in Medicine what it would before. It is worth much more, when unfixed to be uſed in Phyſick, than when it is fixed for the tinging of Silver. For the health of Men is more precious than Gold or Silver. And with an univerſal Medicine, that will Cure all internal and external Diſeaſes, you may get Gold and Silver enough. I have at this preſent time, but a very little of this Stone left, but am reſolved in a little time to make a good quantity of it, that I may therewith ſerve my ſick Neighbours. For it works ſtrange things as you ſhall hereafter hear. This our Stone is ſo powerful in its working, that we dare not give it in ſubſtance, for one Grain of it ſerves for twenty Doſes or more, and each of them hath power to expel from the Body whatſoever is hurtful. This Medicine opens all Obſtructions, and you ſhall hardly find any other comparable to it. The beſt way to uſe it is to keep it whole, and not to powder it, and then it is fit to be uſed both inwardly and outwardly. If you will uſe it inwardly, then put a few bits of it into a Glaſs, and pour Spirit of Wine upon it, in which a little Sugar is diſſolved, and ſo let it ſtand till you have occaſion for it. If you will purge any Body with it, you muſt put a few drops of it into a ſpoonful of Wine or Beer, or any other Liquor, and give it to the Patient, and order him to be kept warm, then the Medicine will work in his Body, like fire upon Wood, and conſume whatever impeded his health, and drive it out by all the Emunctories, *viz.* by Vomit, Stool, Sweat, Urine and Spitting, and leaves no impurity in the Body, and ſo it expels all Fevers and Agues, however diſtinguiſhed. It alſo cures the Plague, Leproſie, Gout, the falling Sickneſs in young and old. It takes away all obſtructions of the Body, *viz.* of the Liver, Spleen, and Lungs, it expels all ill Humours, contained in the Cavity of the *Thorax* and all other parts of the Body. This our Stone alſo opens the Obſtructions of the Meſentery, carries off all Slime, and Salt watry Humidities. It cleanſeth the Stomach and Guts from all pituitous and bilious Slime. It alſo draws all hurtful Humours out of the Brain, takes away noiſe in the Ears, Comforts the hearing and ſight, takes away every Toothach in a moment, faſtens looſe Teeth, and hinders their fouling. It takes away all the Vices of the Throat, Mouth and Tongue, and ſuffers no uncleanneſs or foulneſs to abide thee. It is a pitty to ſee that no Phyſician hath a Remedy for the Toothach, but either pulling them out, or ſtopping them when hollow with *Narcoticks* or hot Oyls, which are indeed no cure: Now foraſmuch as this Diſeaſe troubles People of all Ages, and few know any Remedy for it, I think it neceſſary to ſet down a never failing Cure. 'Tis true, moſt Toothachs may be put off by Purging, and need not ſo painful a Cure, as drawing. Out of Pity to thoſe, who are troubled with the Toothach from their infancy, I here declare the Remedy. ℞. Of our Fire-ſtone, as much as a Pea, and put it into your Mouth, with half a Spoonful of Wine, keep it in your Mouth as long as you can, or ſo long till the Stone hath drawn your Mouth full of Rheume, then ſpit it out, and again put the Stone into your Mouth, with as much Wine as before, and keep it there till your Mouth is again fill'd with Rhume, then again ſpit it out, and continue doing this ſo long, till you have ſpit out half a Pint of Rhuemy Spittle, not reckoning the Wine. The next day again draw out the ſame quantity; do this every Morning faſting ſo long, till no ſlimy matter, but only a clear inſipid water comes out, which is a certain ſign that your Head and Brain is freed from all ſuperfluous Moiſture. When this is done, for a great while you will be free from all noxious Rhumes, or Salt defluxions, which fall from the Head to the Teeth, and there cauſe pain. This our Fire-ſtone doth not only draw all noxious Humours from the Head, but alſo out of the Stomack, Lungs, Liver and Spleen, and carries them out of the Body, by the Mouth, as well or better than any common Purge. But if the Body ſhould be too full of ill Humours, ſo that our Fire-ſtone, ſhould not be able to draw them all out that way, then you muſt take ſome of it inwardly extracted as before mentioned. But becauſe this our Stone is yet unfixed, and therefore ſometime cauſeth Vomits, and ſome are not able to bear Vomiting, therefore you may prevent it, by putting diſtilled Vinegar with Sugar upon the Stone, inſtead of Brandy, and ſo extract it, and this Extract will cauſe no Vomits, but only work by Stool: This is enough to be ſaid for the Cure of the Toothach. But if Parents were ſufficiently knowing, and careful of their Children, they might in their Childhood prevent the greateſt part of this Miſchef, by cauſing them daily to waſh their Mouths, and behind their Ears, with cold water. But in thoſe who are come to Maturity, our Fire-ſtone is the beſt of Remedies and never fails. It alſo cures the Scurvy in the Mouth, when little hot Pimples appear, and the decay or waſhing of the Gums. This Stone being held in the Mouth with Wine, alſo preſerves Old Men from Apoplexies, Catarrhs, and the like. Let this ſuffice to be ſpoken concerning the Virtues of our Fire-ſtone, in the curing of internal Diſeaſes. But becauſe the Variety of Diſtempers is great, I will there ſet down the true way of uſing it, that none may err in its Application.

Of the true uſe of this Medicine in Diſeaſes.

In all Fevers or Agues, let them be Quotidians, Tertans or Quartians, you muſt always give our Medicine two hours before the fit, and keep the Patient from the cold Air. In the Plague, Pleuriſie and other hot Fevers, you muſt not delay the uſing of this Medicine, but as ſoon the Patient is taken, give him a Doſe of our Medicine, let it work with him in a warm Room. And if the Diſeaſe abate not, give him

the next day another Doſe more or leſs, according to the condition of the Diſeaſe and the Patient. And you muſt beware of Bleeding, if the Patient be ſtrong enough to endure a Purge, but if the Patient ſhould not have ſufficient ſtrength, and yet the heat encreaſe, then you may abate the heat by taking away a little Blood, but not too much, that the ſtrength may not be exhauſted with the Blood, and the evil yet remain in his Body, for by Purging, only that which is hurtful is expelled, and the good remains.

In the Epilepſie, you muſt uſe this Medicine only every other, or every Third day, as long as there ſhall be occaſion.

In the Stone of the Kidneys and Bladder, once in a Fortnight.

In the Dropſie, once a Week.

In the Cholick, once after you have uſed a Clyſter.

In the Leproſie, once a Week.

In the Gout of all ſorts, once in three or four Days, until the pain is gone.

In Obſtructions of the Lungs, Liver, Spleen and Meſentery, once or twice one after another.

In the Venereal Diſeaſe, you muſt uſe it every Third day, and Sweat between whiles, till the Diſeaſe is gone.

In the *Hyrocondriack* Melancholy, Scurvy and the like Diſtempers, which proceed from Salt and Cholerick Blood, you muſt take a Doſe every Third day, till the Diſeaſe is gone.

In all ſorts of Scabs and impurity of the Skin, which proceed from watery Blood, you muſt take it once or twice, and apply outwardly a fixed white *Sulphur*.

In the Dyſentery or Bloody Flux, uſe it but once and it ſtays the Flux.

Of the outward Uſe of our Fire-Stone.

If our Antimonial Fire-ſtone be boyled for ſome hours in Sallad-oyl, it draws out of it many Virtues, ſo that being only outwardly applyed, it doth much good in Phyſick. The Oyl becomes red in the boyling, and if it doth not ſo, it is a ſign, that it hath not been well boyled, but if it be well done, it will do what I here ſay. Firſt, this Oyl is good to heal all freſh Wounds, and old Sores, if you dip Pledgets in it, and lay them thereon, and ſo keep it from the Air with a Plaiſter of Wax. It alſo cures all Bruiſes, being anointed with it, or a Cloth dipt in it, and laid over the Bruiſe. A little Cotton being dipt in it, and applyed to the Navel with a Nutſhel, purgeth thoſe, who are eaſily moved, as well, as if they had taken it inwardly: And if being ſo applyed, it ſhould not work with Men, that are not eaſily moved, you may inject a Dram of it Clyſterwiſe by a Syringe, and then it will open the Body, and carry all ſlime and filth from the Guts, and is certainly the beſt Remedy in the World againſt the Cholick. For it doth not only draw what is bad out of the thick Guts, as Clyſters do, but alſo out of the ſmall Guts, yea even out of the Stomach, to the eaſe and admiration of the Patient. This Oyl alſo applied to the Navel and Clyſterwiſe, immediately helps Women, who are troubled with the *Suffocation* of the Matrix, for which Diſeaſe the World cannot afford a better Remedy. And without doubt this Oyl hath many more Virtues than I yet know, but time will diſcover them; for I have not had it long, but am reſolved to have a good quantity of it made to ſerve the Sick: And no doubt, but in a ſhort time this high Medicine of the Stone and Oyl, will be known to all *Europe*. For it will far outdoe the whole *Galenick Apparatus* of Medicine. Certainly thoſe Phyſicians, who ſerve in Armies, ſhould not be without this incomparable Medicine, which is of ſo ſmall Carriage, and doth ſo great things. For one Ounce of this will make at the leaſt a Touſand Doſes, and ſo by conſequence many may be cured by it. If every *Chyrurgian* in an Army, ſhould have but half an Ounce of this Stone, for inward uſe, and ſome Ounces of the Red Balſome, for outward uſe, the Lives of many Souldiers would be ſaved, which for want of it muſt dye. The threatning of Armies is already over our Heads. God ſend us what is good for our Souls, and preſerve the Pious from evil. And ſo we end this Book of the *Fire-ſtones*. If it pleaſe God, the Seventh part of the Proſperity of *Germany* ſhall ſhortly follow.

De

De Purgatorio Philoſophorum:

OR,

A TREATISE concerning the Purifying Fire of the Wiſe Men.

With which, the Philoſophers cleanſe their Mineral, Animal, *and* Vegetable *Subjects, and exalt them to the higheſt degree of Purity, in order to prepare* Univerſal Medicaments *from them, for the Bodies of Men and Metals.*

Which Purgatory Fire is Called Yſopaica, *by the ancient Philoſophers, that is, to ſay, the Art of waſhing with Fire.*

Together, with a ſubjoyned inſtruction, how, by means of the Salt of the World, out of all Metals and Minerals, a living Mercury *may in quantity be prepared.*

From the High-Dutch *faithfully Tranſlated into* Engliſh.

Reader,

IF any wonder at the Title of this little Book, let them know, it agrees very well with the Matter it treats of, foraſmuch as all things that are cleanſed with Fire, may truly be ſaid to be purified by means of a Purgatory. There are indeed beſides this, many other ways of cleanſing as by Water, Lye, Soap, and other moiſt things; but that way cannot properly be called a Purgatory, nor any other, but what is done by Fire. I intend in this Book to treat of three ſorts of Purgatories, *viz.* Firſt, of the ſecret flaming Purgatory, or cleanſing Fire of the Philoſophers, made of *Alcolized* Spirit of Wine, wherewith they purifie the Souls of Vegetables, Animals and Minerals, dignifying them thereby to enter their Heaven.

The other Purgatory God makes uſe of, to purifie his dear Children here in this Vale of Miſery, to make them abhor ſin, and fit them, after many afflictions, and torments endured, for a Tranſlation with all Saints, into his heavenly Kingdom, there to behold his Face to all Eternity.

The Third Purgatory is, that of which the *Chriſtians* of old have Writ, and is to this day ſtill believed by the Church of *Rome*, *viz.* that the Souls of the deceaſed, when by the guilt of deadly ſins, they are not immediately ſunk down into the eternal Helliſh Pains, are in this Purgatory cleanſed of the pardonable ſins they have committed in this Life, and are made worthy to enter into eternal Joy and Salvation.

Now what this Purgatory is, which no Perſon living is able to give an experimental and true grounded Account of, we will, if it pleaſe God, a little enquire into, after that we have firſt expoſed to view, and unanſwerably aſſerted the truth of the two foregoing Purgatories, which our eyes have ſeen, and our hands have handled.

Concerning the Firſt Purgatory.

The Firſt Purgatory, or cleanſing Fire of the Philoſophers, with which they prepare their Univerſal and particular Medicines for Cure of all Subjects of the the three Kingdoms of the World, hath been moſt carefully concealed by them. I have indeed formerly, of Friendſhip and Goodwill, revealed this Fire, with its moſt profitable Uſe, to ſome Perſons, by which means others unworthy have began to perceive ſomething of it, and uſed their utmoſt endeavours to attain the full knowledge of this high Secret, and have ſo far ſucceeded, as to underſtand it in part, *viz.* the Uſe of common Spirit of Wine, which is a conſiderable ingredient of the ſaid Philoſophick Purgatory Fire.

But after all their ſerching, they never attained the knowledge of the *Salt* of Art, by which the Spirit of Wine is *Alcolized*, which is the beſt and chief ingredient of this Fire. Foraſmuch then, as the Spirit of Wine is thus known, and will probably yet further be divulged; I have thought good to publiſh it my ſelf, and to communicate the Secret to all. But as for the ſecret *Salt* of Art, whereby the Spirit of Wine is acuated and fortified, and is the proper Agent for Meliorating of Vegetables, Animals and Minerals, and whereby they are brought to the higheſt degree of Purity, none hitherto have been able to entice it from me,

and

and I trust that for time to come I shall be more cautious of communicating ought to false and wicked Men.

Let no Man therefore imagine Spirit of Wine to be the secret Fire of *Artephius*, whereby some Minerals and Metals, without any foregoing separation of the pure from the impure, may without any diminution of their weight be changed into a mere pure Tincture. No in no wise, for no Spirit of Wine hath any such power. But as for what simple Spirit of Wine is able to perform, that we will here declare, and no more at this time. I doubt not but many will persuade themselves, that in having the Spirit of Wine, they are Masters of the whole Secret; but that's a great mistake, he that questions it, let him read *Artephius*, *Pontanus*, and some few others who write of it, and he will find that a simple Spirit of Wine hath no resemblance with the Fire of *Artephius*.

For the Philosophers who write of it tell us, that their Fire *acts as a proper Agent on its Patient, with an invisible Flame, continually, equally in one and the same degree, and at last changes it into pure Tincture.* Which things cannot be said of Spirit of Wine, which doth not burn continually, equally, or invisibly, from whence it is apparent, that Spirit of Wine is not the Fire of *Artephius*, nor can be compared with it.

Now what this Fire of *Artephius* is, has been sufficiently declared by me, in my Treatise *of the Threefold Fire*, and therefore unneceffary to write more of it here. It remains only for me to declare, how Vegetables, Animals, and Minerals with the help of any burning Spirit, not only that of Wine, but of Corn, Honey, Fruits, Leaves or Gras may be most highly purified, and reduc'd to the Highest Medicines.

In my little Treatise of *Elias the Artist*, I have taught at large how to bring the Essences of Metals, Stones, Vegetables and Animals over the Helm, by means of an Alcolised Spirit of Wine, and to prepare universal Medicaments from them, to which therefore I refer the Lover of Art.

And will now proceed to declare, to how good purpose Spirit of Wine may be made use of in Physick. We all know that in general there are but two ways of cleansing impure things, *viz. Water and Fire.* Now Water can only take away those defilements that are outward and superficial, not being able to pierce to the Center; whereas Fire does not only purge the outside, but even that which is in-most, separating the impure for the pure, as hath already been mention'd.

We know also, that the Flame of Fire can consume nothing but its like, *viz.* the Combustible *Sulphur*, but cannot consume the incombustible *Mercury*, nor destroy, burn, or annihilate it, the Flames serving only to meliorate and exalt it. For the *Mercury* of all things can no way better be purged than by Fire, by which though it be driven away, yet may always be found again, as being incombustible.

For *Mercury* is the best and purest of the three Principles, forasmuch as it cannot be hurt by any Elements, not by the most violent Fire, much less destroyed, because it is throughout Hemogeneal.

There are three things in the World which be incorruptible, the first of which is the *Mercury* of Vegetables, Animals and Minerals, which, when by its Enemy the Fire, it is tormented, and driven from its Body, loseth none of its Virtues, but is only purified thereby. This incombustible Soul of Vegetables, Animals and Minerals, is one of those three things in the World, which are fixed, constant, and unperishable in all trials and conflicts whatsoever.

The second thing which is constant, permanent, incorruptible and invincible is Truth, which cannot be suppress'd by any Lies or opposition whatsoever; Oppressed she may be, but not totally suppressed; for God himself is the Truth, and as God cannot be overcome, so neither can Truth.

The third and last incorruptible subject in the World, is the Immortal Soul of Man; for whatsoever Afflictions or Persecutions a good Man suffers from wicked Men, can not in the least hurt his Soul, but serve only to purifie, exalt, and enoble it. The more Gold suffers in the Fire, the better and purer it becomes, and as true it is, that the Soul by the adversities of time, becomes refined and graduated to the height of Purity, being by this Earthly Purgatory dignified and prepared for Eternal Glory.

But to return to our purpose, which is to shew that the cleansing of Vegetables, Animals and Minerals, must be performed by their own Purgatory, *viz.* a common burning Spirit. We will begin with Wine, as being a very noble Creature, and see what good thing may be had from it, by means of its own Purgatory or Cleansing Fire, which without it could never have been brought to Light.

Now to speak fundamentally of this matter, we must first of all know, that several different Spirits lie hid in Wine, which also may separately be distill'd from it. As in the first place the known burning Spirit; next that Spirit which is distill'd from Crude *Tartar*, which is of a quite different nature from that which is distill'd from Wine, or its Lees, which being kindled burns away in Flame, consuming all the *Sulphur*, leaving nothing but the incombustible *Mercury* or Essential *Salt* behind, and that in a very small quantity, but of great Virtue; whereas the Spirit of *Tartar* which is distill'd by *Retort*, though it be much more subtil and penetrative than the burning Spirit, yet will not suffer it self to be kindled or burnt away, being otherwise of great use in all Tartareous Diseases, and obstructions of the Body.

There is also an Antinephritical Spirit distill'd from the fixed *Salt* of *Tartar* with distill'd Vinegar, which afterwards suffers it self to be sublimed, and being distilled yield a very strong Spirit, of which time doth not permit to treat at present. We will only, point out to you, by what means the most glorious *Mercury* and Essential *Salt* of Wine, may most easily be obtained, and what great things may be perform'd by it in Physick.

℞. Of white *Tartar* well pulverised 1 *l. Spirit* of *Salt* 1 *l.* and half, mix these well together, and fill therewith the fourth part of a Glass Body, and pour on 3 *l.* of Spirit of Wine, lute the head on immediately, for when these two Antagonists, the Acid Crude *Tartar*, and Urinous *Salt* of *Tartar* meet, they furiously attack each other, and in their Conflict send forth a very subtil Spirit, and a glorious Essential *Salt*, which *Mercury* the Spirit of Wine when distilled carries over with it. When now this Spirit of Wine being kindled burns away, the *Mercury* or most pure Essential *Salt* is thereby loosened, and with the Flame goes over into the Receiver, where it is caught of the Phlegm, from which being separated by distillation in a Vaporous Bath 'tis fit for use. This Cælestial *Salt* of Wine is of wonderful Virtue, concerning which I have given a full account in some of my last published Writings.

Its Virtues are chiefly these; It has the Præeminence of all Medicaments whatsoever, in curing the Stone, Gout, and the like Tartarous Diseases. More-

over

over this Heavenly *Salt* penetrates the whole Body, opens all Obstructions, strengthens the Heart, Brain, and all Vital Parts; is a powerful Diaphoretick and Diuretick. Indeed any one may easily imagine, that a Quintessence of Wine, when purified by its own Purgatory, must needs exert wonderful effects, and be of great uses, in the hands of a skilful Physician; of which more hereafter.

Furthermore from Wine, by means of its own burning Spirit, may be separated an excellent Volatile *Salt*, after this manner. Dissolve the Oyl of Wine, which by distillation is got out of the Lees in a strong Spirit of Wine, so as the Oyl may be well united with the Spirit. This done, kindle the Spirit of Wine, and let it burn away under our great cooling Helm or Head, by which means the *Mercury* or *Salt* of Wine goes over with the Phlegm, and is caught by it.

In like manner out of that stinking Oil which is driven from *Tartar* by a *Retort*, and is of great virtue, (though for its loathsom scent it cannot be used) a very powerful Volatile *Salt* may be obtained, by burning away the said Oyl with a burning Spirit, which Volatile *Salt* by those Purging Flames loseth its loathsom smell, and may be made use of in Physick, as that before mentioned prepared from Wine.

According to this method of obtaining the *Mercury* of Wine, we may proceed with all other Vegetables, and separate their pure incombustible *Mercury*, by burning away their Oyls, with their own or any other burning Spirit, by which means the Volatile *Mercury* is caught.

It is to be observ'd, that all Oyls distill'd from Herbs, whose flowers resemble Stars, do yield more Volatile *Salt*, than the distill'd Oyl of other Herbs. When these Herbs cannot be had fresh and green, we may take their Seeds, which yield more Oyl and Volatile *Salt* than the Herbs themselves. In like manner all Oyls, distill'd from Seeds, afford more Volatile *Salt* than those which are forc'd from Roots, Stalks, Leaves or Wood; the Seed always abounding with more Volatile *Salt* than any other part of the Vegetable; and that because God hath placed the growing and multiplying virtue of all things in their Seeds, from whence also the same is most easily separable for the use and service of Man. In particular, the Seeds of Annis, Fennel, Dill, Carway, Cumin, Cresses, Scurvy-grass and Mustard afford much Volatile *Salt*.

So likewise all Excremental and Superfluous Egestions of Nature, such as are the Hair of Men and Beasts, the Horns and Claws of Beasts, the Excrements of Beasts and Birds, as also their Feathers, do abound with Volatile *Salt*. Amongst these we may also reckon Amber, Soot, and Smith's Coals; when the stinking Oyl of any of these is burnt away, the remaining Essential *Salt* will procure the Physicians praise and honour, and the Patient's help and ease.

The Seeds of Henbane and Tobacco do yield a very powerful *Salt*; so likewise do the distill'd Oyls of Spices, as well as those made by Expression afford a most excellent Volatile *Salt* being burnt away, by means of a burning Spirit, united with them. Yet would not I counsel any to burn away such precious Oyls, forasmuch as we have other Subjects, which cost us nothing, and yet yield a better *Salt* than any Spices whatsoever; for Minerals and Metals, when without a Corrosive they are brought into a strong Spirit of Wine, yield a much better *Mercury*, wherein all the virtues of Vegetables are concentred; and consequently are far more efficacious than any Vegetable *Salt* against all Diseases whether of Men or Metals.

In this way we may easily, and in a manner without labour or any considerable charges, procure a running *Mercury* from all Minerals and Metals; which *Mercury* of Metals suffers it self afterwards to be fixed into a true Tincture for Men and Metals, by means of its proper Agent and Secret ever-burning Fire, and this easily without any loss of weight, which cannot be expected from a common *Mercury*, and therefore we must be provided of a Metallick *Mercury* if we would do this feat. *Mars*, *Venus*, and *Mercury* are the best amongst the meaner Metals for this purpose, as yielding the best *Mercury*, but the *Mercuries* of *Sol* and *Luna* are the best of all. And it is a thing that deserves our wonder, that from such Compact Bodies, as those Homogeneal Metals are, which are accounted indivisible, a Volatile *Mercury* should be separated. Indeed had I not done it my self, I should hardly have been perswaded of its possibility. Resuscitative *Salts* are the only means to effect this Wonder, and whosoever knows in due manner to apply them to Metals, to him it is an easie thing, yea, Childrens play, in one days time, without toil or labour, to separate a running *Mercury* from all Metals and Minerals. There is one only *Salt* in the World, which has a power above others to revivifie Metals, costs nothing, and is every where to be had in abundance: This contemptible *Salt* the Philosophers have always concealed, saying, that *it is cast out upon Dunghils, and as much beloved of the Wise, as it is hated and despised by Fools.*

In this *Salt* greater secrets lie hid, than in the *Salt* of Art before mentioned, which cannot be had without toil and labour; but this our more secret Resuscitative *Salt* of Art doth far excell that, for it not only exalts and multiplies the colours of *Sol* and *Luna* as well as that, but also radically opens all Metalline Subjects whatsoever, separating their purest *Mercury* from the gross *faeces*, and brings it over with it self, which no other *Salt* in the World can do. There are indeed some other *Salts* to be found, which in some degree do resuscitate Metals, and separate a running *Mercury*, as *Salt* of *Tartar*, *Urine*, and the like, but are not comparable with our resuscitative *Salt* of Art, which, for all them, continues the undoubted Monarch over all *Salts*. There are very few to be found, who are able with so much ease and little charge to separate a running *Mercury* in quantity from Metals, and fix the same into a true Tincture. Wherefore we should make it our business to enquire into the nature of *Salts*, and learn to know their several uses; because in *Salts* great good lies hid, which few believe or apprehend. *Plato* indeed was of opinion, that something Divine was contain'd in our common *Salt*; and other Philosophers have not stuck to say, that *in the Sun and Salt is All.* He that doth not know what Fire and *Salt* are, knows nothing, and deserves not the name of a Philosopher.

And thus much shall suffice concerning Fire and *Salt*, and the great things that may be performed by them. He therefore who desires to approve himself a good Physician or Chymist, let him study the nature of Fire and *Salt*, and learn to distinguish them, for without this he'l never do any thing to purpose in either faculty.

To return now to our Spagirical Purgatory, and shew that the Philosophers by means thereof performed their greatest Arcana. *Paracelsus* alone, the Monarch of Physicians, gives us a sufficient Testimony hereof, when, treating of the Element of Fire, in his Book of *Sulphur*, he saith, That if a Physician have not amongst his Secrets the Element of Fire from *Sul-*

phur, he is not a Physician, but a——— O my dear *Paracelsus*, thou art not to be blamed for thy zealous inveighing against those Lazy Lubbards, and if thy words be Authentick, 'tis to be feared that scarce one good Physician will be found in all *Germany*, forasmuch as the Element of Fire of *Sulphur* is utterly unknown. But this cannot be said, for that besides this Element of Fire, there be several other good Medicaments a Physician may prepare. Yet forasmuch as I have writ somewhat of it here, I hope it may stir up some to search after it, and so learn to prepare their Medicines by Fire; because whatsoever can without hurt or loss abide the Fire, the same must needs be very pure and good.

David to this purpose gives us a similitude of *Luna*, which must sometimes pass the Fire, before it attain its utmost purity. This art of cleansing things with Fire, was by the Philosophers of old termed *Ysopaica*, of which see *Paracelsus*.

It is to admired, that how black or smutty soever any thing be, after it is wash'd by Fire, it becomes snow white; which the *Mercury* driven by Fire from black *Sulphur* and *Mars*, is alone a sufficient proof of, in which whiteness the fairest Red lies hid. That *Ysopaica*, or the Art of Washing with Fire, and thereby changing Black to White, was in use amongst the Ancients, seems probable from *David*'s words, when he cries to God; *Purge me with Hyssop, and I shall be clean, wash me, and I shall be whiter then snow: David* here desires nothing else, than to have his Soul, which was cole black by Sin, washed and purged by the Fire of the Holy Ghost, and therefore by way of Comparison he mentions *Ysopaica*, or the Art of Washing black things white by Fire. In a word, this Art of Washing things snow-white by a Philosophical Purgatory Flame, appears to be the head skill of Philosophy, Physick and Alchimy.

And forasmuch as I have here made mention of *Ysopaica*, I hope I shall not be thought tedious, if I set down some more instances of cleansing black and impure things by Fire. For seeing this excellent and incomparable Art has for some hundred years been in a manner wholly lost, *Paracelsus* being the first that hath renewed the knowledge of it, I have thought good at present to restore this Royal Art to its former lustre and glory, wherewith it shone forth in the Schools of the Kings of *Egypt*, where those of the Blood Royal were taught and instructed in the same. In which Schools *Moses* also (as being the Adopted Son of *Pharaoh*'s Daughter) had his Education, being there instructed in all the Wisdom and Skill of the *Egyptians*.

In those times this *Ysopaica*, or Art of Washing with Fire was in great esteem and flourished, which was the cause of the great Riches and Puissance of the *Egyptians*, which continued till the Monarchy was made subject to the *Romans*; and yet even then, being Possessors of *Ysopaica* and *Chrysopeia*, they soon put themselves into a condition again of disputing their Liberty with the *Romans*, and rebelled against them; and though by the prevailing Power of the *Romans* they were still overcome, yet did they often reiterate their Revolt; until at last the Emperor *Diocletian* being informed that their Art of Chymistry was their inexhaustible Treasure, which still encouraged them to rebell, sent a great Army amongst them, with Orders to Ransack all Places for Books treating of that Art, and commit them to the Flames; which done, they quietly afterwards endured the *Roman* Yoak, which before, on every occasion, they were ready to shake off. By the same means also the said Art has been as it were totally lost, which I am not without hopes to restore again, and if Death should chance to prevent me, yet will it assuredly be done after my Death by *Elias* the *Artist*. I have indeed already in some of my last Treatises so plainly writ of this Art, that any one, who is any thing skilful in the Fire, may become Master of the Art.

To return then to *Ysopaica*, I say, I have already communicated the use of a Burning Spirit, by means whereof all stinking, impure, Vegetable, Animal, and easily inflamable Mineral Subjects, may be washed to the highest degree of Purity, with which great things may be performed, especially in Physick, and such as are impossible to be done by any known way. Indeed by this alone most profitable discovery, I have discovered a new World of Art, which for so many hundred years has been unknown; and I doubt not, but this way of washing with Fire will serve for a shining Light to lead Physicians to the true Spagyrical Physick.

Thus much shall suffice to have spoken concerning the moist fiery washing by means of a Burning Spirit; it remains now to declare in what manner the Compactest Metals, and Precious as well as Common Stones, may by a dry cleansing Fire be meliorated. For a Spirit of Wine is much too weak to pierce the Bodies of Compact Metals, and to wash them to a perfect cleanness; wherefore we are to look out for a stronger Wash-Fire, which may be able to Master the fixt as well as unfixt Metals. Now Art hands to us a certain dry Wash-Fire, wherewith the Ancients meliorated all Metals and Stones; but this dry Fire has never been published, neither know I any Author that hath writ plainly of it, save only *Paracelsus* in his *Cœlum Philosophorum*, where speaking of *Mercury*, he describes this flaming Wash-Fire, *viz.* ℞. Of *Tartar* part j. *Sulphur* p. ij. *Nitre* p. iij. being well mixed together, use them. *Paracelsus* calls this Composition a good fluxing Powder; but hints at other things, as appears by those words he places before the Description of the said Fulminating Powder, *viz. Pulvis adole Verbenas*, which words conceal a great Mystery, as will presently appear.

The Composition of *Paracelsus* may be meliorated by taking only one part of *Sulphur*, *Tartar* ij. and *Nitre* iij. and is a very good Wash-Fire. There be also many more and better Wash-Fires for to Purifie and exalt Metals, of which we shall hear anon. Follows now the use of the foresaid Wash-Fire.

And first it is to be observed, that to the end this Fire may have the better effect, the Ingredients must be pure, dry, and very well poudred, for by how much purer the Ingredients be, the stronger is the Fire. When therefore we have a mind to wash any Metal therewith, suppose impure *Sol* or *Luna*, we must file the same very small, and then mixing three or four parts of the said Powder with it in a Crucible, kindle the mixture with a red-hot Coal, and the Flame thence arising, will consume all the impurities of the Metal, or separate them as dross, the pure Metals sinking as a *Regulus* to the bottom. And if the Operation be duly performed, the *Regulus* will be as fine as if it had pass'd the *Cupel*.

If we desire yet further to increase the strength of this Fulmen or Wash-Fire, we may take instead of *Tartar* half the quantity of the Saw-dust of dry Lime-tree, which affords a much stronger Flame than *Tartar*, and consequently better purges impure Metals. With this strong Fire we may in a moment purifie a small

quantity

quantity of *Sol* or *Luna* if we please, in a Nutshel; which I do'nt mention here as a thing of Profit, but only of Curiosity, and to shew the force of this Fire.

N. B. If we desire to make use of this Wash-Fire to Profit, we must not take a Common *Nitre* or *Sulphur*, but such a *Sulphur* as burns faster than the Common, and the *Nitre* must be purified, whereof more hereafter.

A Good Fulmen or powerful cleansing Fire for to purifie the Common Mercury, *so as afterwards it may be easily fixed.*

We are to know, that the Common *Mercury* contains in it self an extraordinary fiery Spirit, which hinders it from being a Compact Metal, and keeps it in continual Flux like a Molten Metal, and makes it so difficult a work to fix it: Now if we can but extinguish this Fire in him, he'l be easily reducible to a Compact Metallick Body.

It is notorious, that always a greater Flame overcomes and swallows up the lesser; to extinguish therefore this Fire in *Mercury*, we cannot do better, than make use of a strong Fulmen, which *Paracelsus* hints with those words, *Pulvis Adole Verbenas*, as if he had said, Go Fulmen and burn the Wings of that Volatil Bird, that he may flie no more. But the Fulmen he there describes will not do it, a stronger must be made use of in that case. To this purpose I have made many trials in my Youth, but have found none better than the Fulmen of *Jupiter*, which takes as follows.

℞. Of Crude *Mercury* and fine *Jupiter* each j l. melt the *Jupiter* in a Crucible, and when it begins to cool, pour the *Mercury* upon it, and the heated *Jupiter* will take to it self the *Mercury*, and become an Amalgama, which Amalgama must with dry and purified *Nitre* be ground upon a Stone. This done ℞. of the strong Fluxing Powder abovesaid, the same quantity as the *Amalgama* and *Nitre*, and grind them well together, and then the Mixture is ready for kindling. But the Operation must be performed in the open Air, where the Wind may carry away the poisonous Fumes. The Mixture may be put into a strong Earthen Pot, and after Detonation, there will remain a Mass difficult to Flux, which being Cupell'd, and separated by *Aq. Fort.* affords a considerable quantity of *Sol* and *Luna*, abundantly recompensing the cost and labour of the Operation. After that the Mixture is kindled, the Matter must be often stirred with a red-hot Iron, to the end that no part may remain unkindled, but that the whole Mass may be red-hot throughout.

Another Fulmen to graduate Venus *into* Luna.

℞. Of the foresaid Fluxing Powder of *Sulphur*, *Tartar* and *Nitre*, and grind with it iv Ounces of *Mercury* of *Luna*, and lay the same weight of thin Plates of *Venus* SSS. with your foresaid Composition, kindle the Mass, and the proceeding Flames will graduate some part of the *Venus* into good and fix *Luna* with considerable profit, the Operation being rightly performed. With the same Fulmen, ♂ may be graduated into ☉. and forasmuch as it doth not melt, it's better than *Venus* for this way of working; Needles are best for this purpose.

Another Rapid Fulmen changing Iron and Steel into Good Gold.

℞. Of the abovesaid Fluxing Powder, iv or v ℥. mix with it j ℥ or half an Ounce of *Aurum Fulminans* precipitated from the *Aqua Regia*, not with *Salt* of *Tartar*, but with *Salt* of *Urine*; with this Fulmen and Steel Needles make SSS. in a Crucible. Let not the Needles be above j ℥ weight, else the Fulmen will not be able to graduate them wholly into *Sol*. This Process well managed affords a good increase of *Sol*. It is also no contemptible Curiosity to see Needles chang'd to *Sol*, their pristine form remaining. I took once 20 or 30 Needles, which I put with their points up to the midst in the said Fulmen, their upper halves remaining untouch'd by it, and after Fulmination took out the Needles, the lower part of which was pure *Sol*, the upper continuing Iron, which I distributed amongst my Friends and Lovers of Art for a remembrance. The same may be performed with Nails.

Now though in this Gradation of ♂ there be no very great Profit, yet neither is there any loss; and besides the Curiosity of it, is a convincing demonstration that ♂ without deposing any Terrestreity, may have it's whole Body changed into *Sol*.

N. B. The remaining Fulmen may with a little *Nitre* be melted down to a *Regulus*, by which means the *Sol* is recover'd, and so we have our graduated Needles for nothing.

N. B. When we have a mind to make use of the *Fulmen* of ☉, we had best place the Crucible, in which the *Fulmen* and *Mars* is, in a large glased Earthen Vessel, and as soon as it is kindled cover the Crucible, that the *Fulmen* may not fly abroad, or if any does, it may stick to the sides of the Pot, which being wiped off with a Feather, may be reduced with the remaining *Fulmen* in the Crucible, that there may be no loss.

N. B. It happens sometimes, when too great a quantity of ♂ is taken to be graduated to ☉, and the Flame too strong, that the Needles melt into one, especially if they be laid too close together.

N. B. In Case, the Needles should not in the first Fulmination be wholly changed to ☉, the Work may be repeated with fresh fluxing Powder. And if any one desires more Profit from this Operation, let him mix some of the *Amalgama* of ♃ and ☿ with the Golden *Fulmen*, and Fulminate with the same Needles, or thin Iron Wier, by which means the ☿ will better diffuse the graduating ☉, or Spirit throughout the ♂, and so more of it becomes changed into ☉.

N. B. He that would draw considerable Profit from this Operation, had best perform it in a close earthen Vessel, with a large Recipient fitted to it, for to catch the ☿, which may be used again, by which means that gain will be more.

N. B. For to make this Work yet more gainful, we may instead of the ☉ mix with the *Fulmen* of ♃ and ☿, some fine powdred Red, Brown, or black Pebbles, which are found in running Water, and break as smooth as Glass, and contain much Volatile ☉, grinding them well together. This *Fulmen* when kindled, drives the Volatile ☉ out of the Pebbles, and being received by ♃ and ☿ is fixed by them, by which means much ☉ and ☽ may be had out of ♃ ♀ and ♂. Out of these Pebbles with *Aqua Regis* much ☉ may be extracted, and tho' the ☉ in them be Volatile, yet partly by means of the *Aqua Regis*, and partly by being precipitated with the *Mercurial* ▽ out of ♃, and by Reduction it is fixed: Concerning which I have

have largely treated in the Seventh Part of the Prosperity of *Germany*.

N. B. To work on these Pebbles with more Profit, we may when reduced to fine Powder, extract them with ▽ in which common *Salt* has been dissolved, to which Extraction (which will be of a very high Colour) we must add some of the Resuscitative *Salt* of the World, every where to be found, and then abstract the Solvent from the Extract, by which means the Resuscitative *Salt* will make ☉ more Volatile, and separating it from the fixer Part, bring it over the Helm, in form of a yellow Liquor, which when mortified by a *Lixivium*, and reduced to a dry ☉, if then it be driven through a Retort, you will find a running ☿ *Sol* in the Recipient, in small quantity indeed, but of great Virtue; which by the Fire of *Artephius* may easily be fixed into an Universal Tincture for Men and Metals. A *Lixivium* may afterwards be poured on the remaining Extract, for to mortifie the Corrosive Spirits, and then distilled by Retort, it will yield some more *Mercurial* ☉. As for the fixt ☉ which was in the Pebbles, the same may be easily reduced, and will be good ☉, tho' somewhat pale Coloured, the *Salt* of the World having carried some part of the Colour over with the ☿.

N. B. Our Resuscitative *Salt* of the World is a very wonderful *Salt*, for when joyned with the dissolved ☉, it not only brings over a running ☿, but part of the Colour of ☉ with it, wherefore also the said *Mercurial* ☉ affords a most glorious Medicine, when duely fixed. In the same manner you may get a tinging ☿ from ☽, but much better, and easier from a ☽, which lies Volatile in its own Matrix, and has never touched the Fire.

N. B. But this *Mercurial* ☽ doth not tinge into ☉, but only into ☽. In the same way a ☿ may be driven from all Metals, and in considerable quantity. The ☿ of ♂ and ♃ are the best; those of ♀, ♄ and ♄ are good also, but not so high colour'd, as that of ♂ which is the best. Now to make ☿ of ♂, we need not dissolve common ♂, and thence with *Salt* of the World drive a ☿; but it is better to take Iron-stones, which have never touch'd the Fire, and having extracted them, add to them some of the Resuscitative *Salt* of the World, which then distill'd will yield more ☿ than common ♂. In like manner much more ☿ may be had from ♄, ♄ and ♀ Oar then from the Metals themselves.

I remember, that, in my youthful years, I laboured two years continually with a Person of high quality, to obtain a ☿ of ♄, we tryed all manner of ways but got nothing. Whether it was for want of Experience, or that the Process given us was not true, or because God did not see it fit for us, I know not: But this I know, that we had no knowledge of the universal Resuscitative *Salt* of the World, making use only of common *S. Armon.* and its Volatile Spirit.

I have, in the Seventh Part of my *Pharmacopœia Spagyrica*, taught a way to draw a running ☿ from Metals, but in small quantity, whereas by means of this *Salt* of the World, much more is obtained. I say therefore, that if from my last published Writings, Men cannot discover the way of making the *Mercuries* of Metals in good quantity, it will be a sign to me, that God will not permit it, having plainly set down every thing, except the Resuscitative *Salt* of the World.

And I now say again that the said *Salt* is no where to be sold, since enough may be had for nothing. God must reveal it, for Men will hardly do it. It is a mere Gift of God to know this *Salt* and its use. *Turba* saith concerning it: *If God had not created this* Salt, *it were impossible to perfect our Elixir.* From whence we may see, it is no *Salt* prepared by Art, nor made with hands, but created of God of nothing. Consider well what is here said, and you'l find Wonders. *Cosmopolita* speaks after this manner of this *Salt*, *viz. Nature affords us a* Chalybs, *which can from the Rays of the Sun extract that, which many have sought and not found.*

Other Philosophers speak of this *Salt* in these Words: *The Spirit and* Salt *of the World, bring the Souls of the dead out of Hell.* What is this Hell, but a *Stygian* Water, wherein we dissolve Metals, and after draw forth their Souls with the *Salt* of the World. Of which Spirit and *Salt* of the World, *Nuisement* hath writ a curious Treatise. I say therefore, that he who understands the due way of applying this *Salt*, for drawing the ☿ of Metals, has obtained the greatest Secret in the World, the said ☿ being easily fixable into a true Tincture.

I have known several, who could fix the ☿ of ♄ and ♂ prepared by others into Tinctures, but could not prepare the *Mercuries* themselves: And to this day, I do not know one Man that can bring a running ☿ from Metals, tho' I have communicated the way of making the said ☿ to many, as it is set down in the Seventh Part of my *Pharmacopœia Spagirica*: But seeing so small a quantity prepared that way, they let it drop. It had been well, they could have been satisfied with that: But Men generally are of such a Humour; that if they cannot have all without Toyl or Labour, they presently despond and give over; but they that persevere to the end shall obtain the Crown of Honour.

Thus much shall suffice, by way of Parenthesis, concerning preparing the *Mercuries* of Metals in great quantity, by means of our Resuscitative *Salt* of the World.

Let us now return to our dry wash-Fire, and see, what further may be done with it. We know, that with a Rapid and violent Flame, the Volatile part of Metals is driven away, the fixt and grosser staying behind: As for Example. If I dissolve a Metal, or Mineral in *Aqua Fortis*, and afterwards add to the Solution some good *Niter*, by this means the Metal abides with the *Nitre* and shoots with it into Crystals, which from ♂ are Red, from ♀ Green, from ☿ and ♃ White, from ☉ Yellow. When now this *Nitre* is kindled, the Volatile part of the Metal sublimes from the grosser, and is better for Medicinal use, than the gross Body of the Metal.

N. B. But if to this *Niter* impregnated with a Metal, we joyn some *Salt* of the World; and then detonate it, the said *Salt* through the Flames carries the immortal Soul of Metals out from Hell, that is the ☿ of them, which afterwards may be fixed into Tincture. The said *Nitre* impregnate with Metal, and the *Salt* of the World, doth also, by means of a swift Flame draw the Colours from precious and common Stones, and introduceth others, and better into them again; which is a thing of great Profit to him that hath Skill of it. This is the speediest way of meliorating Metals, when by means of a Rapid *Fulmen*, as it were in a moment, we separate the pure Soul, or incombustible ♎ from the gross Metal: For in this quick Flame the superfluous ♎ of the Metals is consumed, which ties the pure ☿ to the Metal, and makes the same difficultly separable from its gross Body.

In

In this manner a pure ☿ may in quantity be drawn from all Metals, and as much ☿ as is got this way, so much Tincture, for every ☿ of Metals is fixable into Tincture, which cannot be said of the common. And yet amongst these *Metallick Mercuries*, one yields a better Tincture than another, the ☿ of ♂ as hath been said being the best, tho' that of ♄ be good also. He who is come so far as to be able to make the ☿ of any one Metal, with the help of the *Salt* of the World, may easily do the same with all the rest, and then try which ☿ is the best. I have tryed several, but found none better then that of ♂. For which Reason also sometime before my falling Sick, I bought up a great quantity of Steel Needles unfit for common use, with intention to make a great quantity of ☿ of ♂, but being seized with Sickness not long after, and continuing Bed-rid till now; my design was hindred. Now whether God will be pleased to raise me, that I may prepare a good quantity of the said ☿, for those that come after, I know not; for at present by reason of my Weakness, I have no hope to do any thing. And therefore have determined with my self, to manifest these and the like great Secrets to the World, as far as my Weakness will permit; that they who are Lovers of Art may know, and work them, or let them alone as they please: For it shall suffice me, to have discovered the wonderful Works of God to mankind, not at all concerning my self with the rest.

'Tis here to be noted, that the ☿ which by means of the *Salt* of the World, in the moist way is drawn forth from *Aqua Fortis*, or other like corrosive Liquors, is purer than that which, in the dry way is forced over with a strong Fire, yet both are good, and fixable into Tincture. It is also less trouble to bring over the ☿ of Metals in the moist way, than by a strong Flame. For when a Metal is dissolved in *Aqua Fortis*, and *Salt* of the World added to the Solution, then if by *Alembick* you separate the *Menstruum*, part of the ☿ will come over with it, which, as before-mentioned, is to be separated from it: Afterwards drive what remains in the *Alembick* through a Retort, and the *Salt* of the World will carry more of the ☿ over, by which means a good quantity of ☿ will be obtained. For which God be praised, who hath shewed us his poor necessitous Children so near and strait a way to the Land of *Promise*. For I still say (as I always did) that nothing more excellent can be found, either in Physick or Alchimy, than the ☿ of Metals, all other Works being mere trifles in Comparison of it: Because such a ☿ well fixed, is not only the highest Medicine, but besides Tinges ☽ and ☿ inte ☉. I have clearly and fully described the manner of it, Preparation, save only, that I have not named the *Salt* of the World, because it is such a vile and contemptible thing, and cast out upon Dunghils: And yet nothing in the World lives without it. No living Creature in or upon the Earth, Bird in the Air, nor Fish in the Water is sustained without this Universal *Salt* of the World. Concerning this *Salt* of the World, or true matter of the Universal great Stone of the Philosophers, an unknown Author in the Thirty fifth Chapter of his Book writes thus,

That the first Work of the Elixir, is every where to be found.

Concerning the true making of the Elixir, as to its first Work, the Philosophers say, that the true Matter is every where to be found; because it is in every Man, and found with every Man. *Adam* brought it with him out of Paradise, and when he died took it along with him to his Grave. And therefore an Allegory of the Wise men saith, that the said *Matter is subtilized* ☉, that is ☉ advanced to the highest pitch of mineral Virtue. Concerning this ☉ it is said: *With our Gum and little* ☉, *we can buy much.* And *Albertus* in his Book of Minerals saith, and proves it, that ☉ *is every where to be found*: Because there is nothing made of the four Elements, in which, after its highest refining, ☉ is not to be found, and therefore they say it is every where to be found. The same *Albertus* also asserts, that *a great Mineral Virtue is in every Man*, especially in his Head between his Teeth: For that in his time, in old Graves ☉ was found in little longish Grains, between the Teeth of dead Men Skuls, which could not be, except the said mineral Virtue were in Man, which mineral Virtue is in the Matter of our Elixir. And therefore it is said, that the Stone is in every Man, and that *Adam* brought it with him out of Paradise, *&c.*

The Philosopher tells us here, proving it by several Authors, that the true Matter of the Elixir, as to the first Work, is to be found with every one: Concerning which Matter, much might be said, but it is better be silent for fear of the abuse of wicked Men. Yet I cannot but hint here, how it may be made out, that ☉ can grow in the Skuls of dead Men, as before-mentioned. It seems probable then, that these were the Skuls of such Men, who in their Life-time much used ☿, either taking it inwardly, or much handling it in their Trades. Now it being the Property of ☿, to mount upwards to the Head, and settle between the Teeth, we may suppose, that by length of time the *Microcosmical* ♀ did Coagulate it into ☉. Let no Man think this impossible, for the ♀ of Mans Dung hath a very great affinity with the Mineral ♀, which no Body can better witness, than he to whom God hath revealed it, and who hath found it true by Experience.

The Reader by this time hath sufficiently perceived, how the *Mercuries* of all Metals may with ease be brought over, by means of the *Salt* of the World; as also, how the same may be had with the help of a *Fulmen*, or strong Flame of Fire.

Now he that is Master of these *Mercuries*, will not be far to seek, for the way of fixing them; for which there is no nearer way, than to maturate them to a Tincture, by means of *Artephius* his Fire, for all other ways are very tedious, concerning which Fixation by the said secret Fire, the Reader will find more in other Parts of my Writings.

Herewith, then I conclude this First Part of my Purgatory, or cleansing Fire, with which all unclean black Subjects may be washed to the highest degree of Purity and Whiteness. If by chance, I should here have omitted one or other Circumstantial of the Work, (as I hope not) I shall, as it comes to mind, set it down in my following Writings. In the mean time Farewel, and remember the *Salt* of the World, learn to know it, and its Use, for so thou wilt be able to make the *Mercuries* of all Metals, which in value exceed all ☉ and precious Stones.

An Advertisement to the Courteous READER.

FOrasmuch as in this little Treatise, I have revealed many Secrets, and particularly, the easie Preparation of a running ☿ from all Metals, and that a true Tincture cannot more readily be obtained, than from such a ☿, which with ☉ becomes fixed to a Red, and and with ☽ to a white Tincture, and that this Fixation is most easily performed by the secret Fire of *Artephius*. And have also taught, how from all Vegetables and Animals, a most excellent ☿ of great Virtue may be prepared, by means of a burning Spirit; in all which I have writ nothing, but what I have wrought with my own hands. I know there will not be wanting some envious and ignorant Men, who will pretend it impossible to get a running ☿ from Metals: But it is no wonder, that this is counted impossible by those, that have not attained to great Skill and Experience in the Fire, who may well be compared to little Children, who when they hear any Body talk of the Great World, can form no other Notion of it, than of the place, or House where they have been educated; neither can such ignorant conceited Persons believe any thing, but what they have seen themselves. It is enough for me, that I know it to be true.

Now forasmuch as I have before declared, that this ☿ of Metals is the neareſt way to attain an universal Tincture, for Men and Metals, and that out of Vegetables, Animals, and all other things, that admit a Separation of Elements, a ☿ may be had, as well as from Minerals and Metals, and from that ☿ a Tincture: I intend here for further Confirmation, to add the Testimony of an old Book, which with many words confirms what I have writ, concerning the ☿ of Minerals, Animals and Vegetables, and therefore have thought fit, to subjoyn the Conclusion of the said Book, as an Appendix to this Treatise, by which, those, who understand, will perceive that I have writ the Truth, concerning the ☿ of Vegetables and Animals. The Author is unknown to me, but that he was an experienced Philosopher appears from his Writings, which contain great Truths: These as they were gladly received by us, so we highly recommend them to all Learners, and Lovers of Art: Here follow the two last Chapters of the said Philosopher.

A Recapitulation: Or, Summary Repetition.

WE have sufficiently explained to thee the thing, if thou hast rightly understood our words. And observe, Son, that the Operations we deliver in this Book, concerning the Composition of the Great stone, are more subtil than those, that *Geber* has delivered in his Summ: For he saith, that in different intervals of time, it is first sublimed, next fixed, afterwards calcined and then dissolved, and so of the rest. Bu as to this our Book, know, that the Distillation by *Alembick* we call Sublimation, and the Solution of Bodies, we likewise call Sublimation, because by this means the Earthly Body is lifted up into the Air, which is Heaven. Wherefore know, that when we dissolve, we at the same time do Sublime, Calcine, Purifie, Wash, conjoyn and separate. To this purpose, *Haly* in his *Secret* of *Secrets* tells us, that between the Solution and Conjunction, or the Matrimony and Union of Body and Spirit; there is no distance of time; because when the Body is dissolved, it is by that Solution joyn'd with the Spirit, and therefore he saith, that Solution and Conjunction are at the same time. This therefore is the Order of our Operation, which is done at once in one hour: When our Body is put to dissolve in Water, then presently it is solved and sublimed, and by being dissolv'd and sublim'd, the Body becomes united to the Spirit; and if any thing of an extraneous Nature be mix'd with the Body, the same will not be dissolved, but will remain in the bottom of the Vessel for to dissolve, and thus the Body becomes cleansed of the extraneous Matter, if any be in it; yet is it in some sort sullied, nor is it so clean and clear as it ought. Wherefore our Operations in making the Great stone, are more subtil than those contained in *Geber*'s Summ, because what he says is done at several times, is here done at once, and of a subtiler Matter; and after a subtiler manner. And when thou shalt see our work, deareſt Son, then wilt thou know, that we have spoken the Truth, tho' not before: And indeed, except thou shalt give good heed to it, and sharply consider of it, thou wilt scarcely perceive it to be so, because of the quick, subtil and short Operation. But be sure to avoid the fumes in this, as well as other ways of making the Stone, as far as is possible, which if thou shouldst take in, would greatly hurt thee, either at the very instant, or not long after, except thou hast Remedies at hand to oppose their Malignity, which thou oughteſt always to be provided with, that as soon as any such thing is perceived, a proper Antidote may be taken.

CHAP. LVI.

FRom all that hath been said from the beginning hitherto, may be gathered by a piercing eye, that in our Operation our Bodies do not abide in the top of the *Alembick*, as the Bodies of Fools do: Of which *Aros* saith: *The Bodies of the unwise, do only stick to the Cover or Head of the Vessel, and therefore they cannot effect any thing that is true.* Hence also may be gathered, that *Sulphurs* are retain'd by ♄, Bodies by Bodies, and Spirits by Spirits; and every imperfect thing is perfected by one thing, that is by ☿ alone, that is, by a substance, which is produced by our foresaid famous, excellent and glorious Magistery. Wherefore for a final Conclusion we say, that the Blessed stone is one, the Medicine one, to which nothing extraneous is added, nor taken from it, only its superfluities removed. Understand this, as *Hortulanus* saith: That, *That is not extraneous, into which it must be changed*, that is fixed, *viz.* ☉ and ☽. Therefore this stone is Mineral, because it is produced from all Mineral things. But because *Hortulanus* saith, that *Hermes* the Father of all *Alchimists*, was Possessor of the three parts of Philosophy, of the whole World, *viz.* Mineral, Vegetable and Animal: The true knowledge of which three Kingdoms, the said *Hermes* had joyntly, or severally in the work of the Sun; which parts are contained in one only Stone, *viz.* in ☿, that is under the name of ☿, because every thing of which the Stone is made, whether it be Animal, Vegetable or Mineral, is called by the name of ☿. We have also before shewed, how this Philosophy, or Science is compleated in the work

of

of the Sun, by means of a Mineral ☿. Now to the end that this Science, or most excellent Point of Philosophy, may be perfect in every Point, we must see how this Stone may be had, by means of a Vegetable ☿, from Vegetables, and by an Animal ☿, prepared from Animals. And first, we will shew how the Stone may be made, with a Vegetable ☿: For except the Great Stone might be made from many other things, besides those mentioned in the former part of my Discourse, that saying of *Alphidius* would not be true: That *there be many other Subjects, which solve and congeal.* And *Hortulanus* saith, *the Philosophers have called every thing, the Stone, from whence the four Elements may be separated, by our Chymical Artifice:* Now this may be done, from every Vegetable and Animal; wherefore from every Vegetable or Animal, may the Great Stone of the Philosophers be prepared.

The two last Chapters of this Anonymous Philosopher, contain a short Repetition of the Matters handled in his whole Book, wherein he asserts, that the Preparation of the great Elixir, he sets down, is far more subtil, excellent and Skilful, than that of *Geber*: Because the Operations which *Geber* doth successively, one after another, he shews, how they may be done all at once; for that when he dissolves, he at the same time, in the same Vessel, with the same degree of Fire, and in the same Furnace, doth also Sublime, Calcine, Cleanse, Wash, separate and conjoyn: Because, when the hard Body is put into the dissolvent, to be dissolved, it presently turns Black, and is throughly dissolved, calcined, sublimed and joyned with the Spirit. And I leave it to every judicious Person to judge, whether this way must not be very ingenious and Artificial, which at once, so easily and suddenly finisheth all these Operations, belonging to the work of the Stone. Neither was it without Reason, that the Author affirms, that the possibility of this Accurtation cannot well be believed, or apprehended by any, but those who have seen it.

N. B. Now that all these Operations may be done at once, my self can witness, as having before my Sickness performed the same with mine own hands. And however this may sound very strange to those, whose Experience never reached so far, yet is it an undoubted Truth with all those, whom God hath been pleased to illuminate, giving them the understanding and performance of this great (I had almost said, Holy) work.

Our Author in his last Chapter concludes, that of all things from whence the Elements can be separated, the Stone of the Philosophers may be made; to the Truth of which, also I can set my Seal. For when about half a year since, I had recommended to an old Friend of mine, the manner of preparing the ☿ of Wine, and that the said Friend by reason of his business could not come to me, to overlook the Work himself, because he lived in another City, and I by reason of my Sickness kept my Bed: It was concluded by us, that a third Friend should come to my House, and carry on the Work, from the beginning to the end, which accordingly was done in three or four Days. But forasmuch, as in so short a time, we could not prepare any great quantity of the Spirit of Wine, we had but little to burn away, and consequently could not get much ☿, or Cælestial ☉. Now it happened, when we were separating the ☿, we had caught, from the Phlegme, that the Fire, by mistake was too strong, so that after the Phlegme was come over, we found the remaining Heavenly *Salt*, or ☿ of Wine in the bottom of the Glass molten to a Red stone, which could not be dissolved with common Water. Whereupon I ordered some *Aqua Regis* to be poured into the Glass, to dissolve the ☿, which presently succeeded, the Solution being Blood-red. But the ☿ being by this means spoyled, as to any Medicinal use, I resolved to try what it would do on Metals, and accordingly put a little piece of fine ☽ into the Red Solution, left it there two days, and then taking it out, found it changed into ☉ as far as could be judged by the Eye, or Touch-stone. But because I could hardly believe, that ☽ could be so easily turned to ☉, I put it into a strong *Aqua Regis*, to see whether it would be dissolved in the same, as other common ☉, and put a piece of common ☉ with it, to try which of both would be first dissolved: Whereupon I found, that the *Aqua Regis* rather laid hold on the common ☉, than my transmuted ☽, the half of which was only dissolved, and I have the other Part still to shew. Which tryal made me so desirous of proceeding to another, that I got a new instrument prepared, for to make the ☿ of Vegetables and Animals, but have as yet been unable to undertake the Work, by reason of Bodily weakness, and for want of some faithful assistant. Yet am not without hopes, but that with the first I may make some further Tryals, all things being in a readiness for the Work, to which God be pleased to afford his Blessing, *Amen.*

From this Relation it is evident, that a Vegetable ☿ is able to meliorate Metals: That it excels for Physick cannot be doubted, and therefore the said ☿ may be called a Master in both Faculties. Now if a Vegetable ☿ will do this, what may be expected from a *Metallick* drawn from pure Metals, and brought over by the Spirit of Wine? Without doubt, much more than the ☿ of Wine alone, without any Metalline addition. If it please God, I intend to second this Treatise with another larger, concerning the ☿ of Metals. In the mean time, I here make an End.

OF THE

Secret Fire of Philosophers.

By which, They not only brought to Maturity their Universal Medicine, but also fixed particularly all the inferior Metals, into good Gold and Silver, with great Profit.

Written for the Sakes of all the Lovers of Divine and Natural Wisdom.

Faithfully Translated out of the High-Dutch.

Reader,

SEEING that in several of my Writings, I have made mention of the secret Fire of *Artephius*, which *Pontanus* very well called *Proprium Agens*, for no better name can be given it. I thought it convenient to publish this small Explication of it, that it may be known to those, who have not yet heard of it, not doubting, but by this discovery a great Light will be opened to all the Lovers of *Metallick* improvements: For almost all Philosophers, in their Writings, are dark concerning this; and yet without this, no great Matter is to be effected in *Chymistry*: Which daily Experience sufficiently testifies. Therefore I am resolved briefly to explain, yet fundamentally and plainly, by Gods help, this thing which hath been so long hid from the World.

Of the Secret Fire of Philosophers, by which they have maturated their Tinctures.

First you must know, that no Philosopher hath made any mention of it, but hath passed it over in silence, only that ancient Philosopher *Artephius* hath taken some notice of it, but so obscurely, that very few of his Readers, have been able to learn any thing from him. He saith, that himself, like others, had been covetous and envious, so as to write nothing of it; but after he was nine hundred years old, he first began to write of it. *N. B.* It is not credible, that he should have lived to that Age, but perhaps some Body hath added a Cipher to it. 'Tis like he was ninety years of Age, for the Ancients have often mistaken an hundred for ten. But be it as it will, he was the first, that said any thing of this Fire. *Pontanus* writes in his Epistle, that although he knew the true Matter, yet he erred two hundred times, and should never have obtained it, if he had not learned the secret from his Writings. The reason of hiding this Secret so long, hath been only the wickedness of Men, who seek not after these great things, that they might honour God, and succour the Poor, but rather, that by great Riches they might be able to enslave their Neighbours. But when such Men, who have forsaken the Vanities of the World, seek after them, God puts it into their hands, so that striving nor running in this helps nothing, but only Gods blessing. Observe this well, and thou wilt not err. If our eyes and hearts were not blinded by the Pride of the Devil, we should easily see and know, what Fire nature useth in the Earth, to bring Metals to Maturity: By which we might easily learn, what Agent the Artist wants to maturate and bring to perfection all imperfect Metals into Gold and Silver, as good as if Nature had done it in the Earth. Now when we open our eyes and look about us, we find nothing else, but an *Acidum* or Universal Agent, that is, the Sulphurous Salt of *Vitriol*, by which all Metals in the Earth are generated, so that some, by a long time are fixed, and some by a less time, partly remain unfixed, according as the Oars contain more or less of this Agent. And if by a strong Fire, one should melt this Metal out of the Oar, the greatest part of the *Acidum*, together with the Rocky part would come into a Cinder or Slate, but in the Metal, although it be melted and hammered, there yet remains some of the Agent, which the Fire, in the first melting, could not separate from it, especially when the Metals are yet crude; as if the Agent should say, I will not be separated from my Patient, for he cannot yet subsist without me, and also saith the Patient, I cannot yet suffer my Husband, or Agent to be separated from me, for we have not been long enough together. But when the melting Fire comes to it again, then no excuse will serve, but the stronger overcomes the weaker, and the Agent and Patient must part by force. Now what in this violent Separation, the one can carry away with it of the other, it leaves not behind, as we see when the Oar of Iron is melted, that the violent Fire, forceth away the Agent from the Patient, and converts it into Cinders, but yet these are not purely Cinders, for they have attracted a great quantity of the *Mercurial* Patient, *viz.* Iron, which is not turned into Cinders, for if they be melted again, you will have a good quantity of Iron out of the Cinders, and this may be done for several times. If the Agent and Patient had not a great Agreement, they would certainly have been more nearly parted in the first melting, and there would be no need of a Second or Third Fire, and if the Agent should be separated from its Patient, by

the

the force of Fire againſt its Will, yet it cannot be exactly and wholly ſeparated, but the Patient as the Female *Mercury*, doth its endeavour to retain as much as it can of its Agent, or dear Sulphurous Husband with it ſelf, as we have ſufficiently ſeen, that no melted Iron is found without its Agent or *Acidum*. Which appears, if upon a Plate of Iron, you pour a little Water, it preſently Ruſts, which could not be if there were no *Acidum* in the Iron; for the *Acid* adhering ſo cloſe to the Patient, the melting could not force it away. Now when Rain-water falls upon it, the *Acidum* out of Love attracts it to it ſelf, and works to its utmoſt Power, upon the Patient, ſo that it becomes Ruſty.

Which doth not ſo happen to ſuch Metals, as are already brought to ſufficient Maturity, and therefore have no more need of the Agent, as Gold and Silver, for after they are melted, they do not Ruſt by Wet, for their *Proprium Agens*, or *Vitriolick Salt*, has done its Office, bringing its Patient to Maturity, and therefore is eaſily ſeparated from its Patient in melting. Copper alſo, in melting, ſtill retains ſomewhat of its Agent, and therefore eaſily Ruſts, yet not ſo eaſily as the Iron, becauſe it retains not ſo much of the *Acid* in melting, as Iron doth. Lead and Tin retain leſs of it, than Copper and Iron, and therefore do not ſo eaſily attract the moiſt Air and Rain, but only loſe their Splendour by it. Gold and Silver retain but a very little of it, and therefore they cannot eaſily Ruſt, but being moiſtened with ſtrong Corroſives, loſe their glorious Luſter: *Mercury* retaineth all its *Proprium Agens*, having loſt nothing of it. It is alſo to be obſerved, that although *Sulphur* (which contains in it ſelf a pure vitriolated *Acid Salt*) be an Univerſal Agent, by which Nature in the Earth generates and maturates all the Metals, yet notwithſtanding every Metal hath beſides *Sulphur*, a particular *Proprium Agens*, which aſſiſts the Univerſal Agent in its Action. Gold hath, beſides the Univerſal Agent, ſomewhat of common *Salt*. Silver and *Saturn* have beſides the *Sulphur*, and *Vitriolick Salt*, ſomewhat of *Saltpetre*. *Mercury* hath properly for its Agent, a ſubtil, fiery and concentrated Spirit of *Saltpetre*, which keeps him always fluid and current. And this is the reaſon, that Salts or Spirit of *Salts*, (as Spirit of *Vitriol*, common *Salt*, *Saltpetre*, *&c.*) do more eaſily diſſolve ſuch Metals as participate of their own Salts; for example, Silver, *Saturn* and *Mercury* participate (beſides *Vitriol*) of a nitrous Salt, and therefore Spirit of *Nitre* doth eaſily work upon thoſe three Metals, and diſſolve them: For becauſe theſe three Metals have a nitrous Salt in them, therefore the Spirit of *Nitre* hath a good Friend in them, which opens the Gates to it, and lets it in, for the Friend within correſponds with him which is without, as for Example: If an Enemy ſet down before a Town to take it, and hath good Friends within, that open him the Gates, he may eaſily enter, but if his Enemies that are within defend themſelves, and reſiſt him, he can do nothing, but muſt march off without it. Seeing that an *Aqua Fortis* made of *Vitriol* and *Saltpetre*, doth readily touch and diſſolve only Silver, *Saturn* and *Mercury*, it comes to paſs from their near Relation; but the reaſon why they touch not Gold, is, becauſe it hath no affinity with them, for Gold hath no Spirit of *Nitre*, but of common Salt in it, but if you put a little common Salt to the Spirit of *Nitre*, it then eaſily diſſolves Gold, becomes to be of another Nature, and then will not diſſolve Silver, but Copper, Iron and Tin, becauſe theſe Metals contain much ſpiritual Gold, and therefore are eaſily diſſolved by this Spirit of *Salt*. Now becauſe I have here ſhewn the reaſon, why an *Aqua Fortis* made of *Vitriol* and *Saltpetre* diſſolves only Silver, Lead, and *Mercury*, and not Gold, and when common Salt is added to it, that it diſſolves Gold and not Silver, it is for the ſame reaſon, that Salts diſſolved in Water, and impregnated with the Univerſal *Acid* or Oyl of *Vitriol*, will as well diſſolve the Metals, which are boyld in them, as their Spirits will. For Example: Suppoſe I had no *Aqua Fortis*, and yet would diſſolve Silver; I could do it as well by diſſolving *Salpetre* in common Water, acuated with the true Oyl of *Vitriol*, but yet not ſo eaſily as *Aqua Fortis*, and if you ſhould add a little common Salt to it, it would not touch Silver, but diſſolve Gold. And ſuppoſe, I had no Oyl of *Vitriol*, and yet would diſſolve Gold, I might do it by diſſolving *Saltpetre* and common Salt with Allom in Water; yet not ſo well as by *Aqua Regis*. This is not ſaid to that end, that I would adviſe you to diſſolve Metals by Salts and Oyl of *Vitriol*, (for the diſtilled Waters are better than the undiſtilled Corporeal Salts) but that you may the better underſtand and comprehend with what Salt each Metal hath an Agreement to unite eaſily, that you may the better learn to know the *Proprium Agens* of each Metal, for if you will do any excellent thing, in the Metals by their *Proprium Agens*, you muſt firſt know them well, by which you will know, what every Metal Loves, and how it will be treated: Now we cannot learn this better, than when we conſider, what Spirit, or Natural Agent was driven from the Metal by the melting Fire, which if it had remained longer in it, in the Earth, the Metal would have been maturated by it. We find, that in all Oars of Silver, Lead and *Mercury*, is found a nitrous *Salt*, which is driven from it by the ſtrong Fire, now if ſuch a Metal being immature, and not only taken too ſoon out of its Matrix, but alſo by the melting Fire deprived of its Fecundative Spirit, is to be made grow again to be meliorated, you muſt of neceſſity reſtore that to it, which the Fire hath taken away. Now becauſe from Lead there is taken away a nitrous Spirit, beſides common *Sulphur*, you muſt reſtore a nitrous *Salt* for its Agent. And becauſe from *Mars* and *Venus*, a *Vitriolick Sulphur* was taken away, that muſt be reſtored to them again. And becauſe from *Jupiter*, in melting, an Arſenical *Sulphur* and Spirit was taken away, you muſt reſtore it again to the dead Body, to revive it, and to make it grow. If from Gold its Sulphureous Salt be taken away by melting, which the Gold eaſily lets go for the reaſon already alledged, and yet you would maturate this Gold farther, and make it yet better than Nature hath done, you muſt put it into its Matrix again, uniting it with the Sulphureous Spirit of *Salt*, and ſo let it generate or grow afreſh, and you will receive more than Nature hath given: For Nature can give no more, but a perfect Body, which if you will have yet more perfect, you muſt put it again into its Matrix, with its natural Agent, and by the help of external Fire, awaken or excite the inward natural Fire, that its Body may be maturated into a more than perfect Tincture. For Nature can give no more than perfect Bodies, *viz.* Silver and Gold: But if Art begins again where Nature left, it can make the perfect Bodies more than perfect, with this more than perfect Tincture, you may in a moment bring to perfection the imperfect Metals, if you put it to them in melting: To which perfection, a great many years would have been required, before their *Proprium Agens* could have brought them. For if you would maturate the imperfect Metals into Gold and

Silver, by their proper Agents, it would require a long time, but yet it might be done with very great profit, for no other costs are required, but outward Fire, to keep the inward Secret Fire in continual Action; and this work of maturating the inferior Metals may be done in as great a quantity as you please, which makes the profit so much the greater, and this fixation requires no great Cost, for *Mars*, *Venus*, *Jupiter* and *Saturn* cost but little, and the Agent may also easily be had, so that all the Expence is only the Fire, which yet will not be very chargeable neither, so that this Fixation may every year bring in great profit to him that well understands it. If I was younger I should not forbear to go about this particular Melioration of Metals in the whole, to do good with it to many thousand poor People, but my time is now past. God hath been pleased not to shew me this light till within this three years, in which I have lien in Bed, and so I can expect no great benefit by it, as having no Children who are fit to carry it on. But because I can do nothing more my self, I commit it to others, to whom I have already given a good insight; but to discover it more clearly and indiscriminately to the good and bad, being restrain'd by several Reasons I dare not do it. Now it yet remains to give a hint, how the perfect Metals, as Gold and Silver, must be ripened into a more than perfect Tincture, to make the imperfect Metals perfect by Projection.

Now here followeth a Fundamental Process, without any Legerdemain, how to bring Gold and Silver into a Tincture.

℞. Of Gold j ℥, of Silver iij ℥, dissolve the Gold in *Aqua Regia*, and the Silver in *Aqua Fortis*, pour these two Solutions together, and the Silver will attract the Gold, and they will both precipitate into a gray Powder, but if for want of Salt they should not easily precipitate, pour into them some Salt Water, for the Silver will not fall except there be Salt enough. When nothing more will precipitate, it is a sign that these two Bodies, like Husband and Wife, have embraced each other, and are united; then set the Glass in which they are in Sand, that the Liquor may boil, and those two Bodies will be the better united; stir it often, and let it stand so warm for 24 hours, then let it cool, and these two Bodies will grow up together like Herbs or Flowers, filter the Liquor from the Calx, and sweeten the Calx with Common Water, dry it and powder it well, then it is ready to be fixed into a Tincture with the *Proprium Agens* or Secret Fire. Now concerning the proper Agent of Gold and Silver, I say that it is a Mercurial Antimonial Water, which also *Artephius* Confesseth; To obtain which, proceed thus: First put the Conjunction of Gold and Silver into a clean Crucible, which put into a Coal Fire, so that the Gold and Silver may become warm in the Crucible, and yet not be red-hot nor melt, and the sharp Spirits which remained after Edulcoration will pass away in Smoak; when it Smoaks no longer, take it out of the Fire and let it cool, and weigh the Gold and Silver, and so you will perceive how much heavier they are than they were before, for so much have they taken from the Spirits of the Salts, which dried Salt Spirits must prepare the *Antimony*, our Secret Fire, or *Proprium Agens* to fix the Gold and Silver into a Tincture. For Example: We have dissolved and precipitated j ℥ of Gold, and iij ℥ of Silver, and after the exsiccation of the *Calx*, it weighs vi ℥, and so ij ℥ of the Spirits of the Salts are Coagulated with them, and make the increase. For this you must know, that Silver hath this Nature and property, if it be dissolved in *Aqua Fortis*, and precipitated with Salt it attracts much Spirit from the *Aqua Fortis* and Salt, which Water cannot wash from it; but Gold attracts not so much as Silver, for the Gold attracts *Nitre*, and the Silver Common Salt. I could easily shew the reason of this, but that it would be too tedious. *Saturn* attracts more Common Salt than Silver, and these Spirits of Salts are also a *Proprium Agens* to *Mars* and *Saturn*, as they are to Silver and Gold, and work upon *Saturn* and *Mars*, altogether in the same manner as on Gold and Silver, the only difference is, that the Tincture of *Saturn* and *Mars* is not of that extent as that of Gold and Silver, although both of them in this work have one and the same Agent: Now this Agent which is Spirits of Salts Coagulated, as well in Gold and Silver, as in *Saturn* and *Mars*, must first be brought into a Mercurial Water, before they can rightly act upon Metallick Bodies, by penetrating, maturating and meliorating them; to bring them to which, you must proceed thus: If the four Ounces of Gold and Silver have Coagulated two Ounces of Spirits of Salts, you must add to it two Ounces of very clean and well pulverised *Regulus* of *Antimony*, grind them very well together, put this Mixture into a Coated *Retort*, and distil the Mercurial, Antimonial Water, which will also carry over with it the *Animæ* of the Gold and Silver, in form of Butter of Antimony, yet of a high colour, for the Anima of Gold is highly exalted by the *Antimony*, or Mineral *Aries*. This red Solar Butter is the Secret Fire of *Artephius*, or the *Proprium Agens* of *Pontanus*, to bring the Gold and Silver into a Fixed Tincture, which *Artephius* hath used for Gold and Silver, but *Pontanus* (as appears by his Epistle) did not make his Tincture out of Gold, but out of *Mars*; for he calls God to Witness, that the matter of his Stone, out of which he prepared his Tincture, contained many Terrestreities and Superfluities, which he did not separate from it, and yet the *Proprium Agens*, together with what was good in it, *viz.* Iron, came to be a Tincture. Out of this sufficiently appears, that he did prepare an impure Metal, as *Mars*, into a Tincture.

And this is very credible, for such a fiery Agent which I have taught here to prepare, is as well a true Tincture it self, as the *Animæ* of *Sol* and *Lune*, and that so high that it is sufficiently powerful to penetrate, meliorate, and transmute hard, gross, and impure Metals and Bodies, by its tender, clean, Golden, Mercurial Power, and to reduce them into Tinctures. *N. B.* I would have none to doubt, but that such a clean, fiery, and Golden Agent, when it is used for the exalting and meliorating of clean Gold and Silver, will give a much higher Tincture than with gross and unclean Metals; for if Gold is inwardly so exalted and meliorated by this Antimonial Mercurial Water, it must needs give a far more extensive Tincture. Now how this our Mercurial, Antimonial, Saturnine Water, is to be applied to fine Gold and Silver, to exalt their Colours, and transmute them into Tincture, I shall here shew to the best of my knowledge, and it is thus. The two Ounces of Spirit of *Salts*, which were coagulated by the four Ounces of Gold and Silver, and by the addition of two Ounces of *Regulus* of *Antimony*, did again leave the Gold and Silver, by working upon and dissolving the *Antimony*, and did in the distillation carry over the most pure and tender *Mercury* of *Antimony*, together with the Tincture of Gold, in form of a Red Butter; for *Antimony* is of this nature, that it

draws

draws the colour out of Gold, and carries it up with it self in Distillation, which the Ancients called carrying the Souls of the Dead out of Hell. This Red Butter impregnated with the *Anima* of Gold, *Artephius* called his Secret Fire, and is the *Proprium Agens* of *Pontanus*, which doth not only maturate Gold and Silver into perfect Tinctures, but also *Mars* and *Saturn*, in their whole substance, without separating the pure from the impure. From the remaining Gold and Silver you must wash your *Regulus* of *Antimony* by the help of Salt Petre, then separate your Gold and Silver by *Aqua Fortis*, and you will have no loss but only of the Tincture of Gold, which the Oyl of *Antimony* hath carried over with it. *Neusementius* calls this his Solar Red Oyl or Butter of *Antimony*, but I call it my Mercurial Antimonial Aurifick Water, which name doth properly belong to it, which I thus prove. Take of this distilled Golden Mercurial Water, of Leaves of Gold and Silver, each equal parts, put them together in a fixing Glass, and set it in a Sand Cuppel, which is heated equally by a dull *Harry*, and kept in the same degree of Fire, and the Mercurial Water will dissolve the Gold and Silver, and they will turn together into a Stone. The Spirits of Salts after they have dissolved the Gold and Silver, together with the Mercury of *Antimony*, will separate themselves by degrees from the *Mercury*, because they are not of the same matter, therefore they cannot become a Tincture with the Gold, Silver, and *Mercury*, which *Pontanus* very well hints. This separation of the Salt Spirit from the Tincture requires its time, and will not be hastened. *N. B.* But if you know how to separate the superfluity of the Spirit of Salt from the Golden Butter, by a subtile Art, and then dissolve your Gold and Silver in it, you will gain a great deal of time in your fixation, for the superfluous moisture very much hinders, which the Ancients have hinted under a Fable, as the Learned *Bracescus* sufficiently admonisheth in his Treatise *de Ligno Vitæ*. This Salt Water is called by the Poets *Minerva*, concerning this you may read the Philosophers, and chiefly *Bracescus*, what he saith *Minerva* was, and you will find which way it must be separated from the Tincture. *N. B.* Be not in doubt, because *Bracescus* teacheth how to prepare his Tincture, not of Gold and Silver, but of *Mars*, for it may as well be made of *Mars*, only that is not so extensive as the Tincture made of Gold, otherwise the labour is the same, and differs not at all. I repeat this once more, that if you will shorten your labour, you must send away *Minerva* in peace, because she hinders the fixation. Some perhaps may wonder, what the Silver can contribute to this Tincture, because it is white, and hath no colour: I answer, that the inward parts of Silver are not white but red, and therefore may become a Tincture. After the same manner *Saturn* is not red outwardly, and yet with *Mars* becomes a red Tincture, as Silver doth with Gold. This I thought fit to say here concerning the Secret Fire of *Artephius*: If you will know more of it read *Artephius*, *Pontanus*, *Paracelsus*, *Bracescus*, *Neusementius*, *Cosmopolita*, and others, who have made mention of it, and you will there find larger Instructions.

Now as it is possible to transmute not only Gold and Silver, but also the other inferior Metals into Tinctures, by the *Proprium Agens* of Metals, so you may also fix into Gold and Silver, the inferior Metals particularly, with an incredible profit, for the inferior Metals may be put in in great quantity, with a cheap Agent, and so be maturated into Gold and Silver, which hitherto hath been known to very few in the World, but I do not doubt but hereafter it will be better known, by which many honest Men will be delivered from Slavery. For as you have already heard, the *Proprium Agens* of the inferior Metals is cheap, so that the imperfect Metals may be with small costs, by the addition of their Natural *Proprium Agens*, which was driven away in their melting, by the help of External Fire, maturated into the perfection of Gold and Silver. *N. B.* If you can have Metals yet in their Oar, that have not been in the Fire, and add to each of them their *Proprium Agens*, and put them in close Vessels into a fixing Furnace, and maturate them with a requisite heat, then the fixation will the sooner be done, than with those Metals which have been already melted; yet those Oars must be well washed and separated from their Mine-Earth, before you put them with their *Proprium Agens* to be fixed. *N. B.* This fixation of the unripe Metals into Silver and Gold, as also of Gold and Silver into a Tincture, by their *Proprium Agens*, may also be done by the humid way, if you dissolve your Metals in their proper Menstruums, and then digest them for a sufficient time. *N. B.* For such a moist digestion or fixation Vegetables are more fit than Minerals, and Animals fitter than both, yet all of them be made use of to fix both the common, and Metallick *Mercuries*, as well universally into Tinctures, as particularly into Gold and Silver. But for the course Metals and their Oars, the universal Agent, *viz. Sulphur*, *Arsnick*, with their Compeers, as Cobolt and Orpiment are the fittest. Gold and Silver have also their peculiar Agents, by which they are maturated into Tinctures, of which the Animal Agent is found to be the best, for it is of this nature, that it turns the inward hidden colours of Gold and Silver outwards, and renders them visible, which no other universal subject can do like it. For if you cannot bring outwards the inward colour of Gold and Silver, it is impossible to make Tinctures of them. For Gold and Silver, as nature hath produced them in the Earth, have no abounding colour to tinge other Metals withall, but no more than is required for their own perfection; but when they are exalted in their Colours by Art, they are able plentifully to communicate their Colours to other Metals, but else not. Now what kind of Animal Agent this is, by which the Exaltation of Colours may be made, I dare not make common; he that will know more of it, must enquire of *Adam*, who brought such an Essence with him out of Paradise. You may also read my *fifth Century together with the Explication*, where this Subject is treated of. Now as the *Proprium Agens* of the Metals, which is their Spirits, *viz. Sulphur*, *Arsnick*, *Cobolt*, *Orpiment*, and the like Metallick Spirits, are fixed with the Metalline Bodies, and with them become fixed Metals, because they are half Metals already, so on the contrary, Salts which also are good Agents to Maturate Metals, yet become not Metals themselves, as *Sulphur*, *Arsnick*, *Antimony*, *Orpiment*, *Cobolt*, *Zinck*, *Bismuth*, *Lapis Calaminaris*, and other Realgars or Metallick Spirits; for Salts do not participate of a Metallick Nature, therefore they cannot become Metals; but when they touch, dissolve, volatilise, and again fix Metals, it is only done by their Acidity, which is a kind of that Acidity which is naturally in Metals, and this is to be understood of Common Mineral Salts, as Common Salt, Salt Gem, Salnitre, Allome, Vitriol, and the like, which naturally grow in the Earth, in Stones, in Rivers, and also out of the Earth, which are dug out by Men and purified, and so imploy'd for several uses. These Salts have a great affinity with the Metals, but

cannot become Metals. But the Vegetable and Animal Salts are of another nature and property, they associate themselves with Metals, because they somewhat participate, though but little, of the Metallick nature. The Animal Salts are principally Volatile, and make a good *Sal Armoniack*, which hath a great affinity with the Metals, as I have in my Writings sufficiently shewn. The Salts of Vegetables are altered in the Fire, and become fixt Alcalies, which are also of good use to Metals, as you may see in my Writings. But the Volatile Salt of Animals far exceeds all other Salts, in its virtue; for it makes not only all Metals, how fixed soever they are, wholly volatile, and separates the cleanest Tincture of Metals, Minerals, Precious and ignoble Stones, that is, it separates their immortal Anima from their gross and unprofitable Bodies, with which you may perform incredible things, both in Physick and Alchymy; But this wonderful Salt also makes the most subtile, as well good as bad Spirits, incredible quick, surmounting Human Understanding, visible, tangible, Corporeal and fixt, which concentrated and fixed Spirits, have ingress and egress through Doors lockt up, by which strange and incredible things may be done. So great a power hath the Almighty bestowed upon the Animal (chiefly the Microcosmical Salt) above all other Salts, which is known to few. For the Microcosmical Salt, and for want of that, the Volatile Salt of other Animals, Birds, Fishes, as also of Herbs and Woods have power to volatilise all fixed things, and again to fix the volatile. In which volatilising, the purer parts are separated from the grosser, the which being fixt again, you have a Tincture, and there is no neater, easier, or cheaper way in the World to attain to true Metallick Tinctures, than by the means of Volatilising Salts. Take a similitude from the Spirit of Corn or Wine, so long as it is yet in the *faces* of the Corn or Wine, it is little esteemed, but when it is driven out by Distillation, and cleansed by Rectification, and so exalted in its Virtue, then it is Esteemed, because much good may be done with it. So and no otherwise you must esteem of Metals, in which such rare Tinctures are hidden, which then are not esteemed, because few know what great things may be effected by them. The like great treasures are also hidden in great quantities, which by the Ignorant are not esteemed or sought after, notwithstanding that the Ancient Philosophers have highly recommended to us the Extractions, Distillations and Separations of the noblest Tinctures to be drawn out of gross despised Metals and Stones, yet their profitable Doctrines and Admonitions have taken with very few.

Basil Valentine confesseth in his Manuals, that the Work of the Philosophers can be compared to nothing better than to the known labour of making Spirit of Wine, which preparation is known even to Rusticks. The distillation and separation of the Tincture of Philosophers is as easie as to make Brandy, and yet it is done but by very few.

Paracelsus in his *Cœlum Philosophorum*, speaking of the Spirits of Metals, saith plainly, that it is so easie to make Gold and Silver, that it is not worth while to write of it. *Virgil* also sheweth, how easie a thing it is to pluck the Golden Branches from the Opake Tree of *Vitriol*, and how easily they will follow one another, if you but hold forth your Hand, and when you have cropt one, he bids you also take a second. What could be said plainer? But yet I tell you, that these Golden Branches are much more easily, and in greater quantity to be obtained out of the Red Earth or Stones, than out of Metals; but he that will not believe it, may remain in the dark. It is enough for me, that I have plainly declar'd the truth to the ungrateful World, without any reservation. But our *Sal Armoniack* (I do not mean the Common) is a good *Proserpina*, which easily carries over the Tincture of Stones and Minerals. And he that will pluck these Golden Apple bearing Branches with profit, must very well consider after what manner to prepare his *Proserpina*, that she may touch and carry over only the cleanest Tinctures, and leave the gross Bodies behind. The Artist must also be sufficiently experienced, how to separate *Proserpina* or *Minerva* from the Extracted Tincture, for *Minerva* is a hinderance to the fixation of the Tincture. And this is the principal secret in this Mystery. For all Tinctures of Metals and Stones, after they are separated from their gross Bodies, by our *Proserpina*, they are volatile, and so remain till they are separated from our *Proserpina*. Although *Proserpina* is a two fold Key, which both opens and shuts, makes volatile and fixed, yet this is to be observed, that there are but very few who know how to use this Volatilising and fixing Salt; and therefore I advise to separate it from your Tincture, and then fix your Tincture. But if God shall so favour you, as to shew you how to fix this *Proserpina*, or, to speak plainer, our secret *Sal Armoniack*, with this Tincture which it hath drawn out of Metals and Stones, both together without any separation into a fusile, red, penetrating, and tinging Stone, then you may for that bless God all your life, for you may have always plenty, without any want, for there is no richer particular, nor universal Tincture in the World.

For what can be a greater Art than by the help of our *Sal Armoniack*, in a few hours, to draw a pure Tincture out of gross Metals and Stones, to bring it over by Distillation, to purifie it to the highest by Rectifications, and then again to render those Volatile Tinctures in a few hours, fixt and constant in the Fire, so that by them you may immediately tinge the inferior Metals, particularly into good Gold? I *Glauber* truly say this, that this highly profitable Labour, to draw the Tinctures out of Metals and Stones, by the help of our *Sal Armoniack*, to exalt them, and again to fix them, requires hardly twenty four hours time from the beginning to the end. Which to the unskilful will seem incredible, but whether it be believ'd or no, is all one to me. It is the Will of God, that his great Gifts shall not come among the impious, but only remain among those, whom he esteems worthy of those high Secrets, and them who also will make good use of them. *Virgil* at first gave but a hint of it in few Words. Afterwards *Cosmopolita* did explain this great Work at length. Then *Neusementius* published it yet plainer, but the Work is most clearly and largely described in all its Circumstances, by the pious *Brasescus*, in his *Dialogue de Ligno Vitæ*, but it is received by very few, because the proud *Toletanus* despised this cheap Martial Labour, as if *Mars* contained no good at all, but that it was only to be found in Gold and Silver. I ingeniously confess, that I am acquainted with several good Secrets, by which one may reap Profit out of Metals, yet none of them is cheaper and easier, than the Work of *Virgil* upon *Vitriol*, or the *Opake* Tree, to break off the Golden Branches one after another, by the help of his *Proserpina*, or *Eagles* Wings, or *Griffins* Claws. But if one would reap good Profit by this Labour, he must be furnished with a good quantity of *Griffins* Claws and *Eagles* Wings, which also is easie to be had in great quantity, for I have sufficiently

taught

taught how to prepare them. Further, it is needful to know, after we have drawn the Tinctures, out of Red Metals and Stones, by our *Alcaheſt*, how to perfect them, becauſe they are yet Volatile, no Metal can be meliorated by them, therefore they muſt be fixed before they can be uſed. This Fixation may be made in the ſpace of ſix hours, ſo that theſe Tinctures retain their ingreſs and fuſibility, ſo that if they are put upon a red hot Plate, they melt in a moment, enter and tinge as readily, as Oyl doth dry Leather; which all Tinctures do not, but muſt be brought to it by Art, but our Tincture only which is made by Volatile Spirits, doth it: The reaſon is this, all groſs and and fixed Bodies are naturally influxile, on the contrary, all Volatile Spirits again Coagulated into fixed Bodies, muſt of neceſſity be fluxible and penetrating. Obſerve this well, for it is plainly enough ſpoken. Concerning this, ſee the *Epiſtle of Arnoldus* to the Pope, and there you will find this Obſervation. Without this Secret *Sal Armoniack*, no good can be done in *Alchymy*. Thus I end my Explication of the Secret Fire, by which all Metals particularly and Univerſally, are maturated, with incredible Profit, to the perfection of Gold and Silver. Now it remains to give ſome hint, how theſe Secret Fires or Agents, ſeparately by each *Proprium Agens*, may be after a peculiar manner, maturated into Tinctures. You have heard that common *Sulphur* is the *Proprium Agens* of *Saturn*, which becomes fixed with the Lead, and in this Fixation it alſo fixeth and tingeth its Patient the Lead, into ☉ and ☽. You have alſo heard, that *Arſenick* or *Cobolt* is the *Proprium Agens* of Tin, and that *Arſenick* the Agent is eaſily fixed by its Patient, Tin, and with the Tin becomes ☉ and ☽. And alſo, that the common ☿ is fixed into good Silver, with Lead. And all Volatile *Realgars*, as *Orpiment* and its Compeers, may be fixed into good Gold with ♂ and ♀, which is the naked Truth, of which I would have none to doubt, for I my ſelf have ſeveral times performed theſe cheap Fixations, and becauſe I am ſufficiently ſatisfied in it, I dare ſatisfie others.

I have thought it unneceſſary to deſcribe, at large, all the Manuals which belong to this cheap Fixation of the inferior Metals, and alſo to the Coagulation of the Volatile mineral Spirits, into conſtant Gold and Silver. I have therefore publiſhed it as ſhort (yet comprehenſive enough) as I could, that you may ſpeculate into it your ſelves, and then you cannot fail, except God prohibit you, which often happens to evil Men, which ſee eaſie things done before their Eyes, which yet they cannot imitate. Now to put an end to this buſineſs, and to prove that the Univerſal Agent, the common *Sulphur*, which is the Grandfather or *Demogorgon* of all Minerals and Metals, hath alſo its *Proprium Agens*, by which it may be maturated into a Univerſal Medicine or Tincture, I have thought fit to acquaint the World with this eaſie and cheap Fixation of *Sulphur*; chiefly, becauſe I have already, ſome years ſince, treated of this eaſie Fixation of *Sulphur*, but I have not there diſcovered every thing ſo plainly, that every one may prepare it. But now I intend, God willing, to publiſh it ſo clear and comprehenſive, that even any *Mechanick* may not only underſtand, but eaſily imitate it. I pray God to aſſiſt me in it, *Amen*. Some years ago I taught, how, by the help of my *Sal Mirabile*, to fix any common *Sulphur*, but chiefly, ſuch as is yet bound up in Wood or Sea-Coals, and doth not ſo eaſily fly in the Fire, but is eaſier to be handled with a red hot heat, than the open Fluxile common *Sulphur*. This curious Work I have ſhewed to ſome Friends with my own hands, and highly recommended it to them, to take it in hand, and bring it to a good end, becauſe I was certain, that it muſt become a rich, and far extending Tincture. But ſeeing the *Sulphur* would not preſently be fixed, they left the Work: Whereupon I farther divulged this Work by writing, and made it common. Notwithſtanding which, as yet very little hath been attempted about it, becauſe every one is in haſte, and hath not Patience to wait for a good end, not conſidering that every thing muſt have its time, and that haſte makes waſte. Muſt not the Plowman, when he ſows his Corn into the Earth, to have an hundred fold encreaſe, wait the due time before he can have this Multiplication? Why ſhould not then alſo a *Chymiſt* wait his time, for this profitable Fixation, that will recompenſe him a thouſand fold? Now to return again to our buſineſs, to ſhew that any common Combuſtible *Sulphur*, which otherwiſe is an univerſal Agent for all Metals, to maturate them into Gold and Silver, hath alſo its own *Proprium Agens*, by which it is not only maturated into ☉ and ☽, but alſo into a true univerſal Tincture; and this is done only by certain *Salts*, that have Power to fix the *Sulphur*, and make it conſtant in the Fire. *Coſmopolita* minds us of this very well, when he ſaith, that Salt, in the conflict with *Sulphur*, gave him a deadly Wound, which is very true, and beſides Salt or ſtrong Spirit of *Salt* hath Power to fix it, if they be ſeveral times drawn off from it. How this is to be done, I have taught in my *Three Principles of Metals*. But ſuch a *Sulphur* as is fixed by *Aqua Fortis*, is alſo quite killed, and its ingreſs into Metals is taken away, but may be reſtored to it again, ſo that it eaſily enters Metals, and tingeth them throughly. *Paracelſus* ſaith, you muſt reverberate the fixed ♃, till it comes to be Red, and then draw out the Tincture, with Spirit of Wine, and then fix ☽ or ☿ with it into Gold. *Neuſementius* teacheth to drown the Dragon in the *Stygian* Waters, that is to fix him, and when he is come to the higheſt degree of fixity, that then you muſt revive, or Volatize him again, and then fix him the ſecond time, and then he hath a better ingreſs into Metals to tinge them. *Braceſcus* teacheth alſo, to extract his fixed *Sulphur*, out of the fixed Scales of Iron, and to fix them into a Fluxile and penetrating Tincture. *Coſmopolita* teacheth it after this manner, *viz.* how to deliver *Sulphur* out of his Priſon, and that he will give to his Redeemer a Crown of Three Kingdoms for a Recompence. Out of theſe, the true Fixation of *Sulphur* is ſufficiently to be learned, and needs no farther inſtruction, but yet I cannot forbear here to ſet down my way, how to fix it, that the Artiſt may ſo much the eaſier attain his End. And this Fixation of *Sulphur* may be done after ſeveral manners.

And Firſt in this: I have taught, how *Sulphur* may be fixed into a Red Carbuncle, perſiſting in the Fire, where I have treated of my *Sal Mirabilis*: It is true, this way of fixing is done without any coſt, yet it requires a certain, tho no very long, time, which is the reaſon, that hitherto few have tryed any thing in it, and yet it is very difficult to come eaſier and cheaper to the Fixation of *Sulphur*; and beſides, there is this advantage in fixing the *Sulphur* with the *Sal Mirabile*, that it retains its eaſie Flux and Ingreſs into Metals, which that fixed by *Aqua Fortis* doth not, but into an unmeltable Earth, which hath no ingreſs into Metals except it be procured by Art, which every one cannot do. Yet *Neuſementius* hath clearly deſcribed it in theſe Words: When thou haſt brought thy Subject to its higheſt Fixation, to wit, by the Abſtracti-

on of *Aqua Fortis*, (which Fixation he also clearly teacheth, when he saith, that you must drown the Dragon in the *Stygian* Waters, and so make him fixed) and after the Fixation make him Volatile again, that then he acquires his ingress, and is fit to tinge, which is so plainly exprest, that it is impossible to express it plainer, yet these excellent Writings, are written only supervacaneously, and understood and imitated but by few. I still add even to superfluity, one way more how to fix any *Sulphur* whatsoever, to do wonders in Physick. ℞. Sea-Coals, or in defect of them, Wood Coals powdered, good *Saltpeter*, Common Salt, and Oyl of *Vitriol*, of each a like quantity, put these four things into a Glass Retort well coated, fix a Receiver to it, and in an open Fire distil off all the Humidity, urge it at length with the strongest Fire, and a Green Liquor of *Sulphur* will come over, which the Ancients called the Green Lyon, which dissolves ☉, and when they are digested a good while, or the Green Liquor is often abstracted from the ☉, then they are fixed together, and the Liquor of *Sulphur*, together with the ☉, turns into a Red tinging Stone. *N. B.* If you will that the *Sulphur* shall not come over, but remain fixed behind, you may instead of the common Salt, which makes the *Sulphur* Volatile, put *Saltpetre*, which is of this Nature, as well as Oyl of *Vitriol*, to make any *Sulphur* fixed, but common Salt makes it Volatile. *Jason* killed or fixed the always watching Dragon with a strong Water of *Saltpetre*. *Bracescus*, *Basilius*, *Paracelsus*, *Neusementius* and others have done the like, he that will truly follow them; cannot err, but it is impossible to explain to the ignorant any thing, so that he may presently imitate it. You must yourself take the thing in hand, and proceed diligently, else nothing can be done: Let this suffice to be said concerning common *Sulphur*, which is an Universal Agent, to maturate all Metals, and it self is fixed with Metals, into ☉ and ☽; and also by *Saltpetre* and *Vitriol* is fixed into a true Tincture, as is here demonstrated. Here I put an end to the Explanation of the Agent, and Patient of Metals, how to fix them particularly into Gold and Silver, and Universally into Tinctures. It yet remains to give a small Explication of the Fixation of *Sulphur*.

A RECAPITULATION

Reader,

I Have taught in this Book, what the *Proprium Agens* of Metals is, by which they are naturally maturated in the Earth, *viz.* That the *Demogorgon* or *Sulphur*, is not only the Father of all Metals, but also their Universal Agent, or Maturating Fire, by which all the Metals naturally in the Earth, and by Art out of the Earth are brought to perfection, and that also besides *Sulphur*, as the Universal Agent, the Metals have their particular, or proper Agents, which help to bring the Metals to perfection, as well as the Universal Agent. I have also taught, that the Volatile Spirits of Metals, or their proper Agents, do not only maturate their Metals, but also become good Bodies themselves with the Metals. I have also taught, how *Sulphur*, as a Universal Agent chiefly by Salts, may be maturated into a Tincture, which Fixation by Salts, must have its due time, before you can make it constantly fixed in the Fire, which length of time hath made many Artists forsake the Work, altho' he knew, that of necessity it must come to a good Tincture. Impatience causeth this, that they cannot wait the true time of the Harvest. Wherefore impatient Men should not meddle with *Alchymy*, but rather drink a Bottle of Wine, which is sooner done than a Combustible Fugitive *Sulphur* can be fixed. The learned Ancients have taught us, that Patience is the Root of all Sciences and Arts, wherefore then are Fools so hasty in their Undertakings? When all Philosophers Unanimously testifie, that all Festination proceeds from the Devil. *Paracelsus* hath taught how to fix *Sulphur*, by the help of a strong *Aqua Fortis*, by abstracting it from it four or five times. But I have taught, how to fix it by the abstracting of a strong *Aqua Fortis*, but once, in my Book *of the Three Principles*: 'Tis true, by this way it loseth its Fluxibility and Ingress, but this may be restored to it again, which for certain Reasons, I did not think fit to make known. Now being we know, that nothing fixeth but *Sulphur*, and that a Combustible *Sulphur* spoils the Metals, and makes them Black, and a fixed one hath no Ingress, but when that is given to it, it is fit to tinge the Metals, for whatever tingeth the Metals constantly, must it self be fixed, or else it would not endure the *Cupel*. 'Tis true, out of *Mars* and *Venus*, you may easily extract a Tincture, which yet doth not tinge constantly, except they be first truly fixed. Very many have thought, that if they could but incorporate a *Crocus Martis* with Silver, that of necessity it must become Gold, but they found themselves to be mistaken, for if *Crocus Martis* should be put upon Silver, it doth not tinge it at all, but again becomes Iron, and makes the Silver brittle. *N. B.* But if you know how to prepare a Red *Sulphur* of Iron, constant upon the *Cupel*, without returning to Iron again, and then draw out of this Red fixed *Sulphur*, its purest Anima or Tincture, you have a Colour to tinge all the Metals in the World. This is the Reason, that the Old Philosophers have so often inculcated, to destroy the Gold: So that it cannot be reduced into Gold again, and that then you would have the greatest of Secrets. But I could do nothing more with such a destroyed Gold, till I learned to give it ingress, for when it is destroyed it enters no Metal, but if you give it ingress, then it tingeth, so also neither *Mars*, nor common *Sulphur* can tinge, if they have no ingress which you may easily believe.

Therefore the whole Art to make Tinctures consists, first in making of the red Metals as Gold, Iron, and Copper, irreducible, then to extract their Tincture, and to give an Ingress. This labour is a very easie thing to the knowing, but incredible to the unskilful; for I have some years since, shewn to some Friends out of kindness the destruction and fixation of such Metals, together with the Extraction and Ingress, very plainly, and highly recommended to them this universal work; they have performed the fixation, but the Extraction and Inceration they have not done, although it is so easie that a Child of Ten years old may easily perform it. My hopes were, that when they had perfected it, they should give me some of the Tincture, but in stead of a recompence, they told me they could not do it, which was because God kept his hand over it. After the way that is here shewn, Tinctures may be easiest prepared out of red Sulphureous Metals and Stones, and I have a small quantity of it by me, which will tinge red, I made it before my Sickness, and keep it as a memo-

rial

rial to my Posterity. Some perhaps may ask, whether there be not a nearer way to prepare Tinctures for Metals, than by Extractions and Fixations, which require much time and Costs. I answer, 'tis certain there are nearer ways to fix *Sulphurs* in their whole substance without loss of weight, without any addition of Salts or Spirits of Salts, very easie and cheap, *viz.* by the Universal Coagulator into a Tincture, and by their particular Coagulators into Gold and Silver. Concerning the Coagulators I have already made them known, *viz.* that Lead is the Coagulator of Common *Sulphur*, and Vulgar *Mercury*, Tin is the Coagulator of *Arsnick* and *Cobolt*, Iron and Copper are the Coagulators of *Orpiment*, *Sandarach*, and all other Realgars, and that Gold and Silver are the Coagulators of the *Mercury* of *Antimony* into a Tincture. Now concerning the Universal Coagulator, 'tis not a Malleable or fusible Metal, but only an immature Volatile Mineral, not much unlike to Lead Oar, and therefore the Philosophers have called it the *Saturnine Magnesia*, and this is not all one and the same, for it is found in different colours and figures, so that he who will use them must well understand their difference, that he may not take the wrong for his work, and so lose his labour. The Ancients have not revealed this Volatile Mineral, but kept it as a Universal Coagulator in the greatest secrecy, and that not without reason, because they maturated their Volatile Metallick Spirits and Tinctures by it. Yet the Volatile Tinctures may also be fixed, without this Universal Coagulator, but that requires much time; therefore they have used this Coagulator for an help, and so they could maturate the most Volatile Metallick Spirits into fixed Tinctures, in a short time, and this Compendium is the chiefest thing in the Chymical Art, see the Treatise of the *Three Principles of Metals*. Now to return again to *Sulphur*, and to demonstrate, that it may be easily made fixed in the Fire, which is thus: Take one part of Common *Sulphur*, mix it with three or four parts of Lead Ashes, put this mixture into a strong Earthen Cementing Box, lute it well with a good strong Lute that will not crack, when the Lute is dry, put it into a Cementing Furnace, or into such a Fire, that in the beginning will only melt the *Sulphur*, so that it may penetrate the Lead Ashes, and hide it self in them, and so be initiated to the Fire, then by degrees increase your Fire from day to day, till at length the Crucible become to be of a dark brown, then increase your Fire still more, and continue this so long till the *Sulphur* becomes quite fixed with the Lead Ashes, and constant in the Fire; and this will require eight or ten months time, during which time the *Sulphur* becometh fixed, and hath tinged and fixed its Body, the Lead as much as it could, for it is not possible for it to fix all the Lead after this manner into Gold and Silver, but only part of it, yet so that an hundred-fold profit is made of it, if you proceed rightly in the matter. The reason of the melioration of the Lead is this: If *Saturn* hath power to make a Combustible *Sulphur*, incombustible and fixed in the Fire, so that it neither fumes nor burns, then it is certainly as good and fit for tinging as another *Sulphur*, which is made fixed by much labour of abstracting *Aqua Fortis* from it. In this Fixation the *Sulphur* retains its Ingress, and therefore needs not to be given to it afterwards, for it had an Ingress when it was not fixed, and when it is made fixed it still retains it. This makes good that common saying of the Philosophers: If *Sulphur* shall first penetrate *Saturn*, and *Saturn* attracts it willingly by reason of its great dryness, and unites it self with it, then it is said that *Nature rejoyceth in Nature*. When it can be made red-hot with the Lead, then it is said, *Nature overcometh Nature*, but when the fixed *Sulphur* remains constant with the Lead upon the *Cupel*, then it is said, *Nature retains Nature*. This which I here declare so plainly, all Philosophers before me have kept very secret, but that I here reveal such great secrets, I have a reason for it, which is not necessary for every one to know. Now as we have here taught the fixation of *Sulphur* by Lead, after the same manner the fixation of *Arsnick* is to be done by Tin, which becomes fixed with it in the Fire, to the great profit of the Artist, it recompenseth him with Gold and Silver upon the *Cupel*; and this Work the Philosophers always kept very secret. *Cosmopolita* writes, that there is a small Fish in the Sea named *Remora*, which hath such power, that if it sits upon the Stern of the Ship, it causeth it to stand still, so that although the Wind fills the Sails, yet it cannot move. In another place, he calls this Fish *Echineis*, which if you read backwards, sounds Tin Ashes. Other Philosophers also write of this work of Fixing, that there are always two sorts of Birds in the Nest, or two sorts of Dragons in the Den, that one of them would willingly stay, which is the Body, but the other which hath Wings, would always fly away, yet at length it is by degrees so overcome by that which hath no Wings, that at last it endeavours no longer to fly. The same happens here to our Volatile *Arsnick*, that is, with the fixed Tin Ashes, the Volatile part *Arsnick* is always striving to fly away, but the Tin Ashes binds and keeps it, that it is forced to stay against its will, and also become fixed with its Companion. Now as we have here proceeded with *Arsnick* and *Tin*, and with *Sulphur* and *Lead*, after the same manner must be done with *Orpiment*, and *Mars* or *Venus*, but with *Sulphur* and the *Mercury* of *Antimony*, together with Gold and Silver, the fixation is performed after a peculiar manner, which fixation I have already declared, and therefore need not repeat it. This I would have noted concerning the Agents and Patients of Metals, but I am very well assured, although this fixation is very mean and easie in it self, that yet it will not easily be imitated, and that because I have made known so great a Secret in so simple and mean a Style. The World is full of Pride, and cannot give credit to such mean things, but rather looketh after high, tedious, and sophisticate things, which are worth nothing, if they are but set off with fine words; God will have it so, that these great Secrets may not fall into the hands of the Impious. Here, in the fixation of the Common *Sulphur* with Lead, and *Arsnick* with *Jupiter*, *Orpiment* with *Mars* and *Venus*, I have spoken openly, and hid nothing, yet I am certain it will not be taken in hand, partly because of the length of time required in the fixation, which will deter many from this work, many who shall read it will not be able to believe, that so easie a fixation hath been done, because none hath hitherto written of the like cheap way of Meliorating Metals, nor spoke so plainly as I have done. Many will take Exceptions at my Person, and say, if it was true what *Glauber* writes of the easie fixation of the inferior Metals, to transmute them into Gold and Silver, he would do it himself, and thereby make himself rich, and not publish things of so great a concern. To this I answer, that my great Age, and many weaknesses will not permit me to take such things in hand,

by

by which nothing but Worldly Riches are acquired, which sometimes do Men more harm than good, which I never did nor ever will seek after. If others will do it, they may. I trouble not my self about the Mammon, but prepare my self for a happy passage into a more peaceable Life, where there is no strife nor misery, but everlasting Peace, and everlasting Light reigns perpetually. But in that I have discovered these great Secrets, by which those who seek after them, may become very rich, I have done it out of a good meaning, *viz.* that if many by this shall attain good means, that some of them at least may assist the poor out of their abundance. To this end only have I discovered these Lucriferous Secrets, and not at all to please the Proud and Covetous. But yet although I have described all plainly without any reserve of the Manuals thereunto belonging, I am very well satisfied, that God will keep his hand over it, and will not indifferently give his Blessing to all in it, but will so dispose it, that his gifts may not be misused. And therefore I am very well satisfied, that Art will remain Art, although it be never so clearly laid down before the Eyes of all Men. To whom God will give it, him I envy not, but wish him Gods Blessing with it, and earnestly exhort him, that when God hath blessed him, that he by no means forget the Poor. *Amen.*

A

TREATISE

CONCERNING

The Animal-Stone:

OR,

Of that Animal Matter or Subject which God ingrafted into Adam *and* Eve, *as a Divine Portion or Patrimony in Paradise, and which he still retained after his Fall and Banishment out of Paradise, brought it with him thence, and after Death took it along with him to his Grave, or to the Earth from whence he was taken and made; What kind of Matter properly it is, and in what manner a true Universal Medicin may be made of it. Faithfully Translated out of the* High-Dutch.

The PREFACE.

Curteous READER,

HAving in some of my last Published Writings, and especially in my Fifth Century, treated of a certain Matter, called by the Ancient and Modern Philosophers, The Philosophers Stone, *which Matter they say, God implanted in the first Man* Adam, *and which after his Fall and Banishment, he brought with him out of Paradise, and after his Death, took it along with him to his Grave, without revealing this Divine Patrimony and Portion to any of his Posterity; so that this great Treasure continued for some time hidden from the wicked World, until at length it pleased God to open the Eyes of some honest Men to know and discern this great Gift of God, which they also made known to others, though this communication of theirs was of little use to proud Worldlings, whose Eyes are only fixed upon outward Visibles, not minding the inward Invisibles. Wherefore none of them could believe, that so great a Treasure was hid in Sinful Man, as accounting nothing worthy their esteem, but Gold, Silver, and Precious Stones, and casting out upon the Dunghill as loathsom and contemptible what is far better than Gold or Silver.*

And

And becauſe ſome of my Enemies have ſlandered ſome of my Writings, as if they contained abſurd and impoſſible things; to the end that none by their Lies and Slanders may be led aſide from the way of truth, I am reſolved to ſet the Truths I have written in a greater Light, and palpably to evidence before the whole World, that what I have taught, viz. *that a Mineral Aurifying Virtue lies hid in Vegetables and Animals as well as in Metals, is no abſurdity, but a great truth, to the ſhame and confuſion of my envious Adverſaries.*

O thou Eternal Light, without the leaſt mixture of darkneſs, Creator and Governor of Heaven and Earth, ſend down upon me thy holy Spirit, beam into my Soul a Ray of thy Heavenly Light, that it may enlighten my Heart, Brain, and Underſtanding, that I may write nothing but what may ſerve to thy Glory, the ſalvation of my Soul, and the enlightning of many thouſands that wander in the darkneſs of Error. Amen.

OF THE ANIMAL-STONE.

IN the Name of the moſt Holy Trinity, I undertake to communicate and declare to the dark wicked World, the great Wonder-works of God, and Myſteries of Nature, and that with ſo much clearneſs and evidence as never hitherto hath been done by any; ſo as not only the good, and ſuch as are taught of God, but alſo the perverſe Worldly Learned, or the moſt ignorant Ruſtick may comprehend, underſtand, and even handle with their Hands, that I have fundamentally declared and manifeſted the Myſteries of God and Nature, to the glory of God, and good of Mankind.

In order to perform the great Work I have undertaken, it is needful that we know firſt, what the thing is, we are to ſeek, and next, where we are to ſeek for it. The thing we ſeek for, is the Philoſophers Stone, which affords the Poſſeſſor thereof health of Body, and an honeſt plentiful Maintenance. Now foraſmuch as moſt of the Ancient and Modern Philoſophers, a few only excepted, point us to Metals, and eſpecially to fixt *Sol* and *Luna*, thence to procure for our ſelves this great Treaſure, though they handle this matter with ſo much obſcurity, that amongſt an hundred thouſand Seekers, ſcarcely one is found that attains to his deſired End, moſt of them beſides ſpending their Goods and Eſtates in the fruitleſs purſuit of this hid Treaſure; whereof thoſe in a great meaſure are guilty who perſuade Men that *Sol* is the Subject of the Philoſophers, and that all other matters are improper and unfit for their Work; But others again inform us, that this great Treaſure may be obtained a nearer, eaſier, and cheaper way, without *Sol* or any other coſtly Subjects; Concerning which cheap, and every where to be found, Subjects, I have made mention in ſome of my late publiſhed Writings, and particularly in my Fifth Century, yet not ſo plainly as wholly to expoſe theſe Pearls to ſwine, for them to tread them under their Feet. And foraſmuch as ſeveral ignorant and envious Perſons have taken occaſion to appear and contradict theſe my Writings, as if it were impoſſible to find Mineral Virtues in Vegetables or Animals, I am moved to ſtop the Mouths of theſe envious and ignorant Back-biters, and to expoſe them to the Publick ſhame of the World. I confeſs, I do not think theſe Slanderers worthy that I ſhould take any pains to confute or convince them of their Error, becauſe I am not to mind what ſuch as they, but what honeſt Men, and what truth it ſelf, ſpeaks. But becauſe this demonſtration may be of uſe to undeceive and inform many Seekers after this Treaſure, I ſuppoſe I ſhall do a good work, in giving this evident teſtimony to Truth, whereby not only the Mouths of Slanderers may be ſtopp'd, but the Eyes of the Deceived may be opened to diſcern the Truth.

We proceed then to hear the Verdict of Truth in this Matter, whether indeed ſuch a Mineral Virtue be hid in Vegetables and Animals, as that the Philoſophers Stone may be prepared of them. And firſt we will ſpeak of Man, as being the Nobleſt of all Gods Creatures, and then proceed to the four-footed Beaſts of the Earth, the Fowls of the Air, Fiſhes in the Sea, and all Creeping Things, and laſt of all to Trees, Plants and Herbs, to ſee what the Almighty Power of God hath laid up and hid in theſe for the uſe and welfare of Mankind.

As to Man, the moſt Excellent part of Gods Creation, whom God made a Ruler and Governor over all his Creatures in Paradiſe, we know that he was made very good, without the want of any thing that might conduce to his happineſs or perfection, which goodneſs continued in him after his Fall, though much clouded and veiled. Foraſmuch then as God hath been pleaſed to lay up in Man this great Treaſure, to the end he might make uſe of it for his good and perfection, we muſt conclude, that the Divine Wiſdom hath placed it ſo, that Man may always have recourſe to it, and take thereof, (without any hurt to his Body) to the glory of God, and his own good. For had God placed this Treaſure in the Fleſh or Blood of Man, he would have been obliged to hurt and weaken his Body by cutting a piece of his own Fleſh, or letting out his Blood, in order to prepare this great Medicin, which by this means would prove too dear, ſo that moſt Seekers would rather want the Medicin, than attain it this way. But God, who is the Eternal Wiſdom it ſelf, hath not been guilty of any ſuch overſight in his Works, which are all perfect, and no fault to be found with them; and if Nature in any of her productions prove defective, that is not to be attributed to God, but to Satan, who whilſt Man ſlept ſowed the Tares amongſt the good Seed, which the Maſter of the Houſhold had ſowed in his Field.

If it be ſo then, that God hath not laid up this great Treaſure in the Fleſh or Blood of Man, we may further enquire, where then we are to look for it? Certain it is, that God, our Heavenly and Wiſe Father, hath laid up this great Treaſure in Man, where at all times, without any let, pains or trouble, he may come at it,

and have it for nothing, *viz.* in the Superfluities of Nature, as Urine, Dung, Hair, Sweat, and Spittle. I ſay that in theſe deſpicable Excrements and Superfluities of Nature, God hath laid up a great Portion for Man, which he by reaſon of his Pride, blindneſs and hardneſs of Heart, cannot ſee or perceive.

Another Queſtion that may be here demanded, is, In which of theſe Excrements this Treaſure is moſt copiouſly to be found? To which I anſwer, that it may be had from any of them, but in the one more plentifully than in the other, but which is the moſt fit and proper for this Work, I dare not plainly ſet down at preſent, for fear of expoſing and proſtituting this Pearl to the Wicked and Unworthy, which all honeſt Philoſophers have ſo highly forbidden. But this I will do, *viz.* moſt clearly demonſtrate, by many inſtances, that out of all the Natural Excrements and Superfluities, whether of four-footed Beaſts, Fiſhes, Creeping Things and all Vegetables, a Mineral Aurifying Virtue, that is the Matter of the Philoſophers Stone, may be had, and that without coſt and charges in all parts of the World, ſo that no body, how mean ſo ever he be, but may have enough of the matter for nothing, and needs not by his Poverty be deterred from undertaking this great Work, that affords Health and Riches to him that can bring it to an happy end.

I proceed now to thoſe Proofs and Experiments that evidently make out, that in all things (beſides Metals) a Mineral Virtue and Power is found, whereby the Philoſophers Stone may be prepared. I ſhall begin firſt with four-footed Beaſts, becauſe I do think it fitting for ſeveral weighty Reaſons, at this time to paſs by the Myſteries that lie hid in Man, that they may not be expoſed to the Wicked and Unworthy. Now theſe Excrements and Superfluities of four-footed Beaſts as well as of Man are different, according to their diverſe Paſſages and Places of Production, as Urine which makes its paſſage through the Bladder, Dung through the Guts, Sweat through the Pores of the Skin, Spittle through the Mouth, and the Hair or Wooll of Beaſts, alſo through their Skin or Hide, and accordingly are of different Virtues and Powers. Upon this account we muſt conclude, that in the Sweat of Men or Beaſts, there is not ſo great virtue as there is in Urine, the former being a ſuddain and almoſt inſtantaneous Generation, whereas the later requires ſome hours time before it can paſs through its ſeveral Chanels, and be made fit for Natures ſeparation. So likewiſe is Mans Dung a long while a paſſing through the Guts, which in Man and Beaſts are much longer than in Birds or Fiſhes, to the end that the Dung might be the better putrified and digeſted; Thus we find by Experience, that the Dung of a Stork which paſſeth only through one ſhort Gut, when it falls upon the Graſs doth preſently burn and ſcorch it, whereas the Dung of Men and Beaſts laid to the Roots of Vegetables, or any way conveyed to the ſame, do ſtrengthen and invigorate them, and are indeed the higheſt Medicin of Vegetables; as Country Farmers well know, who with the help of the Dung of Men and other Animals are uſed to cure their ſick, barren, and overwrought Fields, Vineyards and Orchards, reſtoring them to their former ſtrength and fertility. But though ſimple Ruſticks be very well acquainted with the great virtue and uſe of Dung, yet our great Learned Men cannot believe, that in ſuch a deſpicable Subject ſhould be lodged ſuch an Excellent Univerſal Medicin, capable to cure the Diſeaſes of Men and Metals; and the reaſon is, becauſe they love Pride and Idleneſs too well, will not put their hands to the work, contenting themſelves with what they know already, without ſearching into endleſs Secrets of Nature. For this cauſe it is, that true Medicin and Alchimy are advanced to no higher degree of Perfection. *Helmont* complains of this negligence in Phyſicians, who leave the preparation of their Medicins to Apothecaries, declaring, that every Phyſician who deſires to have good and rightly prepared Medicine muſt be both Maſter and Servant, that is, he muſt truſt the Preparing of his Remedies to none but himſelf.

The preſent Subject I am upon, *viz.* the Excrements of Men and Animals puts me in mind of a Story relating to *Paracelſus*, which take as follows.

A Relation of what happened at Vienna *between* Paracelſus *and ſome of the Imperial-Court Phyſicians.*

Paracelſus being on a time ſent for by the Emperor to *Vienna*, to cure ſome Perſons of high Quality, whom the Imperial Phyſicians could not help, having ſucceſsfully performed the Cures he was ſent for, went to take his Leave of the Phyſicians, who earneſtly intreated him to leave ſome of his noble Medicaments with them for a remembrance; whereupon *Paracelſus* anſwer'd, that he would fetch ſomething for them; The Phyſicians, ſuppoſing he intended to beſtow ſome part of his prepared Medicins upon them, with impatience expected his return, who ſoon after came to them, and ſet down on the Table before them a Silver Diſh cover'd with another Diſh. The Phyſicians were very deſirous to ſee what *Paracelſus* had brought for them; at laſt one of them taking off the Cover, found a great Turd in the Diſh, at which being exceedingly enraged, taking for granted that *Paracelſus* had done this to affront them, they all departed, and when ſome call'd them back, *Paracelſus* ſaid, Let the Aſſes go, they do not deſerve this great Secret, which I intended to communicate to them; And then added, He who doth not know what Mans Dung is, knows nothing, and Heaven and Earth are equally hid from him. With which words he ſufficiently intimated, that a great virtue is hid in Mans Dung. Thus much ſhall ſuffice, by way of Parentheſis, to have ſpoken concerning *Paracelſus* his Opinion concerning the Superfluities of Nature, and particularly the Excrements of Man, we proceed now to ſpeak of the Excrements of other Animals, and in particular of Sheeps Wooll.

An Experimental Demonſtration, that a Mineral Virtue is hid in the Hair of Beaſts.

℞. Of clean Sheeps Wooll iv Ounces, and pour upon it a like quantity of ſtrong *Aqua Fortis*, abſtract this *Aqua Fortis* wholly in Balneo, and the *Aqua Fortis* will diſſolve the Wooll, and when abſtracted, will leave behind a ſtinking Stone of a dark brown colour; afterwards diſſolve in another Glaſs Body of *Mercury* j Ounce, and of the fineſt *Sol* iij Ounces, pour theſe Solutions of *Sol* and *Mercury* into the Glaſs wherein the diſſolved Wool is, then abſtract the Menſtruum from the Metals, till nothing remain but a dry Stone in the bottom of the Glaſs, take this Stone and put it into a Glaſs Retort, and diſtill the *Mercury* from the *Sol* in a ſtrong heat. *N. B.* The *Mercury* will not come over quick, but in the form of a Butter of *Mercury*, of great uſe for the healing of incurable Venereal Ulcers. If you pour ſome Water upon the ſaid Butter, it will precipitate the *Mercury* in form of a white Powder, which being edulcorated and dried, is a good Purge in Venereal Diſtempers. But if you rectifie this Butter, and then pour it upon

upon a pure Calx of *Sol*, the Butter will diſſolve the *Sol*, and being afterwards digeſted for ſome time, the *Mercury* by means of the Saline Spirits of the Wool will be fixed with the *Sol* into a Stone, with it make a trial upon Metals, to ſee what it can do, and thou wilt find thy Labour richly rewarded; but if thou canſt not hit it, then think, that it is not the will of God thou ſhouldſt have it, and do not blame me, who have ſet down nothing but what I have performed my ſelf. Now let us ſee what courſe we muſt take to recover our *Sol*; break the Retort, and take what was left at the bottom of it, which thou wilt find black as a Coal, in which black matter thou muſt look for thy iij Ounces of *Sol*, foraſmuch as the Butter has carried but very little of the *Sol* over with it, which thou may'ſt ſeparate from the black matter, as follows.

Melt good *Nitre* in a ſtrong Crucible, and when it is in Flux, caſt into it one piece of your black Matter after another, and the *Nitre* will burn away the *Sulphur* contained in the ſaid Coals or black Matter, and the *Sol* melts down into a Body, pour forth the *Nitre* together with the Golden *Regulus* out of the Crucible into a Cone, and the *Sol* will ſettle at the bottom in form of a *Regulus*, which, when ſeparated from the *fæces*, appears ſnow-white and brittle, much reſembling a *Regulus* of *Antimony*; the *fæces* are of a red colour, and contain much good. This white *Sol* being expos'd upon the *Cupel* with *Saturn* to a fiery trial, a third part only of the *Sol* will be found remaining of the colour of good *Sol*, two parts being vapour'd away. The Queſtion is now, What that white colour was, which evaporated on the Teſt? If thou ſay'ſt, that the Coals of the Wool, with the help of the *Nitre*, have rob'd the *Sol* of its colour, thou art not altogether out of the way, nor wholly in the right. If thou ſay'ſt, that there is no Mineral Virtue in the Wool, but that the *Sol* became white by the addition of *Mercury*, thou art not wholly out of the way neither; but this is not to be underſtood of the Common *Mercury* added to the *Sol*, but of the *Mercury* contained in the Wool, which has joined it ſelf with the *Sol*; for Common *Mercury* cannot abide with *Sol* in a ſtrong melting Fire, but flies away, leaving the *Sol* alone, as is well known to Chymiſts. If thou ſay'ſt, that there is a Mercurial Virtue in the Wool, which within a few hours ſo changeth the Common *Mercury*, that it is able to abide a melting Fire with *Sol*, then it will follow, that by means of the *Salt* which is in Wool any Common *Mercury* may in a ſhort time be made capable of enduring not only a melting Fire, but the *Cupel* alſo. This I ſuppoſe is a plain and evident demonſtration, that there is a Mineral Virtue in Animals, and eſpecially in the Superfluities of Nature, which we will now proceed to demonſtrate with another Experiment. Now if the Superfluities of Animals are able to do this, have we not reaſon to conclude, that the right Superfluity of the Microcoſme will do the ſame much better?

Another Experiment to demonſtrate, that a Mineral Mercury *and* Sulphur *is contained in the Superfluities of Animals.*

℞. Of filed or raſped Horns of Sheep, Oxen, Goats and Deer, but Harts and Goats Horns are the beſt, and the Horns of Wild Goats, and the Tusks of Wild Swine yet better; and the Horns of Fiſhes, which are commonly called Unicorns Horns, and the Elephants Teeth are the beſt of all for this purpoſe; but where theſe cannot be had, the Experiment may be performed with Goats or Harts-Horn. Diſſolve ij Ounces or iij of either of theſe in a good *Aqua Fortis* which has been abſtracted from decrepitated *Salt*, into this Solution put j Ounce of *Sol*, abſtract in a Glaſs Body the *Aqua Fortis* from the Horn, in which abſtraction the *Sol* becomes diſſolved, and a brown Stone is left behind, which muſt be melted down in a cover'd and well luted Crucible with a blaſt, by which means the Horn will be turned into black *fæces*, and the *Sol* will fall white to the bottom, brittle as a *Regulus* of *Antimony*; from whence it follows, ſince this brittleneſs and whiteneſs of the *Sol* could not be cauſed by the *Aqua Fortis*, that the ſame muſt be attributed to the white *Mercury* and *Sulphur* drawn from the Horns. Whereby it clearly appears, that a Mineral force and virtue is hid in the Horns of Animals. What I have ſaid concerning the covering of the Crucible with another, and well luting them together, is not without reaſon, for if the Crucible ſhould be ſet open in the Fire, and continue there for ſome time, the *Sulphur* of the Horns would be kindled and conſumed, and the *Mercury* would be revivified and fly away, and the *Sol* would remain unalter'd. For it is to be noted, that the Mineral *Mercury* and the *Sulphur* of the Horns are very tender and volatile, and are ſoon loſt when the operation is not performed, as before hinted, in a cloſe luted Crucible. This Experiment may be done in like manner, with the Superfluities of Fiſhes, *viz.* their Skales, Teeth, and the Stones or Bones that are found in ſeveral of them, and the effect will be found the ſame as before mentioned.

The ſame may alſo be performed, with the Feathers and Egg-ſhells of tame and wild Fowl. *N. B.* Egg-ſhells are diſſolved with more eaſe than Feathers. ℞. The Egg-ſhells of Hens, Geeſe, or other Fowl, waſh them clean, taking out the inward skin or film, then dry them, and abſtract from them a Solution of ☉, and melt the remainder in a cloſe covered Crucible, and you will find the ſame effect, as before.

If you have a mind to make the ſame Tryal with Vegetables, then take *Tartar* which is fitter for this purpoſe, than either the Wine it ſelf, or the Wood of the Vine, inſtead of *Tartar* of Wine, you may take the *Tartar* that cleaves to the Veſſels, wherein the juice of Crabs hath been keep, or the juices of any other ſowr Fruit, or inſtead of *Tartar* we may take the Grounds of Wine, firſt dried. ℞. Any one of theſe, and abſtract from it a Solution of ☉, melt the remainder as before in a cloſe luted Crucible, and the ☉ will be found white and brittle, like to a *Regulus* of ♂ at the bottom.

From theſe Experiments it appears, as clear as the day, that a Mineral Virtue is hid in all things: Yet for more abundant Confirmation of this Truth I ſhall add ſome further Inſtances. The ſame proof may be done with dry or moiſt Herbs, or Wood, proceeding in the ſame manner as before hath been taught, with Wool, and we ſhall find the ſame effect. In particular, all ſort of Corn, Rye, Wheat, *&c.* afford a very good Tincture, they muſt be diſſolved, and proceeded with as before mentioned, concerning the ſuperfluities of Animals. If therefore Mineral Powers may be found in all Vegetables and Animals, on which Man feeds, and hath his growth and Suſtenance, how can it be denied, but that the ſame Power muſt needs be in Man alſo? Wherefore it is beyond all doubt, that every Man carries the matter of the Philoſophers-Stone (tho' raw and unprepared) about with him.

To make this Truth to appear, with fuller and clearer Evidence, I am minded to give the ignorant a ſenſible Demonſtration, that (without mentioning the

righ

right Subject of the Philosophers-stone) an universal Medicine for Men and Metals, may be had alone from the despicable and abominable Subject of Mans-dung.

℞. Six, eight or ten ℔ of some healthy Mans-dung, (it must be gathered without any mixture of Urin) and put it into a Glass-body, and pour upon it about the same quantity of rectified Spirit of Wine, stir them with a stick together, set the Glass, with a head fitted to it in *Balneo*, and abstract the Spirit of Wine, which has extracted the Mineral ♃ and ☿ that was in the Dung, and brings it over the Helm: Which stincking Spirit of Wine must be burnt away under a large Refrigeratory Helm, by which means the stincking ♃ of the Dung is consumed in the Flames of the Spirit of Wine, and the incombustible Mercurial *Salt* mounts up in the Flames to the top of the Helm, where it is caught, and is a great Jewel in Physick and Alchimy. If we have a mind rather to have our Celestial *Salt* in a dry Form, then we must abstract the Phlegm from it: Tho' if we intend it for a Medicinal, it is better not to abstract the Phlegm (which is not wholly without some Virtue) but use them together. But if our intent be to make use of this incombustible Mercurial *Salt*, in order to *Metallick* Transmutation, then we must separate its Moisture, and mix the said Microcosmical *Salt* with ☉, and maturate the same to a *Metalline* Tincture. In a Liquid Form, the said Celestial *Salt* is an excellent Medicine for sick and weak People, as having great Sympathy with the Vital Spirit of Man, wonderfully strengthening the same, and in all Diseases performs whatsoever can be expected from an Universal Medicine; and is not in the least loathsome, being purged from all Stinck and ill Taste, by the Flames of the Spirit of Wine.

This *Aqua Vitæ* of the Philosophers performs also very wonderful things in the Vegetable Kingdom, for if the Seeds of any Herb be steeped for an hour in the same, and then laid upon a Trencher, or any board at some distance from one another, and covered over a Fingers breadth with Earth or Sand, being then exposed to the warm Sun, the Seeds immediately will begin to shoot and grow, even visibly to the Eye, which is very pleasant and curious. But those Seeds which are soft, are more proper for their speedy growth, than those that are hard: The Seeds of Parsley, Cresses, Fennel and Annis, which abound with much Volatile *Salt*, are the best for this Purpose. So that we see, that this Medicine prepared of Mans-dung is truly Universal, as curing the Diseases of all the three Kingdoms, *viz.* of Animals, Vegetables and Minerals. Wherefore if any one can find in his heart, to work upon this loathsome Subject, he will need no other, for that all lies hid in it, which gave one of the Ancients occasion to say,

Laudat Præsentem quælibet Herba Deum.

Each Herb from Earth its head doth raise,
Its present glorious God to praise.

I cannot, but repeat this great Truth once more, that the highest Medicine in the World is most commonly to be found in the most despicable Subjects, God having ordered it so, for to make known his Almighty Power; and that he regards the Welfare of the Poor, as well as of the Rich, willing that all should be helped and relieved, who do not by their own Pride, Laziness and Wickedness withstand so great Love and Mercy. Had Gods Will been to communicate this Treasure only to the Proud, Rich and Covetous, he would have laid up the same in ☉ and precious Stones, which the Poor cannot go to the Price of, but behold we find to the contrary, that God hath been pleased to hide this Treasure in such despicable and loathsome Subjects, as the Rich do scorn to meddle with, by which means a Door is opened to the Poor, to obtain that which, they reject and despise.

But to return to our Subject, and yet further to Evidence, that a *Metallick* Virtue is hid in Mans dung, (tho' it be not the true Subject, which the Philosophers point at in Man) and that much good may be done with it, as containing a very glorious ♃ and ☿; I will add this Experiment, lay a Piece of Silver into a Chamber-Pot, wherein is Dung and Urine, let it lye there for some time, and the ☽ will attract the ♃ or Animal Gold, that is in the Dung and Urine, and become colour'd like ☉, which is a sufficient Demonstration, that the matter of the Stone is hid in those Subjects. And forasmuch as it is notorious, that ♃ is the Agent and ☿ the Patient: And that the ♃ alone tingeth, and that ☿ is only tinged: Wherefore it behoves us to fix the ♃, whereby it is fitted to tinge the ☿, bind and fix it: Which to bring about, much searching has been in the World, and still is, tho' for the most part all in vain, very few Seekers going the right way, and therefore mist of their End, tho' in their Search they have found many Arts, some good and others as bad. So we read, that one *Bartholdus Schwartz* a Benedictin Fryar having found in an old Book, that ♃, the Father of Tincture, may be fixed with *Saltpetre*, was resolved to make a Tryal of it, but to no purpose, for the ♃ and *Nitre* being kindled by the Fire, broke his Vessels, Furnace and all to pieces, whence he took occasion to consider further of the Matter, and invented that mischievous thing called Gun-powder, tho' he fail'd of his fixing of ♃: The Ancient Philosophers, many Ages ago, were not ignorant of that Composition, but would not Communicate the same for Fear of the abuse thereof: And called it a *Basilisk*, because it kills all things it looks upon. Others have set forth *Nitre* and ♃ under the Notion of a watchful, never sleeping, and Fire-spitting Dragon, that guarded the Golden *Fleece*, which *Jason* by *Medeas* direction and Counsel cast into a deep Sleep, and so took away the Golden *Fleece*. *Medea* signifies diligent Study and Meditation, *Jason* the Artist, or Laborator, the Soporiferous Medicine given to the Dragon, the due Fixation of the Matter. Another Benedictin Fryar, *Basil Valentine*, had better Success in fixing ♃ with the help of *Nitre*, which Fixation he hath recorded in his Writings, where he makes *Saltpetre* to speak thus: ♃ *is my best Friend, and withal my greatest Enemy, but when we are duely conjoyned, and made our Marriage Bed in Hell, after we have well sweat together, we cast off all our Impurities, for to beget Children of Wealth and Riches; and in our dead Bodies is found the greatest Treasure, which we bequeath by our last Will.* These are the Words of *Basil Valentine*, wherein he exactly and plainly describes the true Fixation of ♃, save only that he hath not named the Medicine wherewith the watchful Dragon is to be cast into a dead Sleep, and that for good Reason, because the whole Art and Master piece of fixing ♃ with *Nitre* consists therein. And *Paracelsus* writing concerning ♃ saith: *Here with few words many may be helped, were it not against God, for God wills not that all should be Rich, and therefore doth not give the Goat as long a Tail, as to a Cow, for fear he should out of Pride beat out his own Eyes therewith: For when a poor Man grows Rich, it commonly makes him Proud, and as sharp as a Razor to others.*

These

These are the Words of *Paracelsus*, wherein he declares a great Truth, for God will not have all Men to be Rich, because of the great abuse of Riches, which is too too common in the World. But to those, who are dead to the World, and look upon Riches, Money and Goods, as Dust and Smoak, and are Enemies to all sin and wickedness, to these God gives more than themselves desire or wish for, because he knows they will not abuse his Gifts. And so much shall suffice at this time, for my design is not at present to treat of the Fixation of ☥, which I have elsewhere done at large, but only to prove and make out, that the Matter of the Philosophers-Stone is to be found in all things in the World, which I think I have done already. Will any make a Tryal, and undertake the Work, 'tis free for him so to do, I have in this Discourse pointed out the right way, tho' I have not revealed the right Matter: But if what I have here set down be well considered of, by the ingenious Seeker, it cannot be long hid from him: Farewel.

A Corollary: Or, Appendix to the foregoing Discourse.

I Have in this short Treatise abundantly shewed and verified, that in all Vegetables and Animals, a mineral Virtue lies hid, which is able to Coagulate ☿ in Conjunction with ☉, into a Metal: And that I may be further helpful to the Lovers of Art, I intend here to deliver the whole manner, and Process of fixing ☿, by Excrements and natural Superfluities, to the end that every one, who reads and considers of it, may with ease attain to a true Tincture. In order to which, I am first to put the Reader in mind, what I have already hinted, that as these Superfluities of Nature, are different and various, so some of them are better for the fixing of ☿ than others: The best of all being, that which *Adam* brought out of Paradise, as a Childs Portion God had bestowed upon him, which I dare not name openly, but shall only set down here, how this Fixation of ☿ may be performed by means of the Superfluities of Animals.

I have, in the foregoing Discourse, declared the manner of Coagulating ☿ with the Wool, or Hair of Animals, so as to suffer himself to be fluxed with ☉ in a strong Fire, without evaporating, only to shew the possibility of it. But now shall set down, how the said Fixation may with Profit be performed, by means of an Animal *Salt Armoniack*. For certain it is, that in Man and all Animals, such a Secret *Sal Armoniack* is to be found, especially in Urine, Hair, Claws, Horns, Skins, *&c.* as also in the Blood, sweat and spittle of Man, which is of force to coagulate and fix *Mercury*.

N. B. The fasting Spittle of Man Coagulates running ☿, being stirred about with a Pestle in a Glass, or Stone Mortar, and so is made fit with Hogs-grease to be made into a Salve. Now after that common ☿ is thus Coagulated with fasting Spittle, if we mix it with Oyl or Butter, to make a Salve of it, we shall find that the ☿ will not unite with the same, but runs together, and becomes quick as before, and only suffers it self to be joyned with melted Hogs-grease, but with the fat of no other Animal whatsoever; the Reason without doubt is, because Swine have a great affinity with Man and Metals. Thus we find, that Mans and Swines Blood have this Property, that if the *Calx* of ♄ be for some time boyled in either of them, the ♄ becomes white and hard like ☽; the Reason of which the Reader may be pleased further to enquire into. Mans Urine also has this Nature and Property, that at one only Sublimation it so Coagulates ☿, that when ♀ is rubbed over with it, it looks as well as if it were Silvered over. And the sweat of Man is partaker of the same Property, of Coagulating and Metallizing ☿, so likewise the Excrements of Man and Beasts, *&c.* But nothing does it more readily than Mans fasting Spittle, wherefore also *Albertus Magnus* saith, that the highest Mineral Power hath its Seat in the Head of Man, and especially between his Teeth, he himself having found, oblong Grains of ☉, between the Teeth of a dead Mans Skull; 'tis very probable, that the Person, to whom the same belonged, had taken ☿ inwardly, which naturally tending to the Mouth and Teeth, had been fixed there by the Mineral Virtue of the Microcosm into good ☉. Now if we see this happen thus in the Body of Man, what reason have we to doubt, but that the same Mineral Virtue may, without the Body of Man, not only fix ☿ into good ☉, but also reduce it to a true and perfect Tincture. Forasmuch then, as this is not only possible, but certain and unquestionable, I having wrought it with mine own hands, and knowing many other easie ways, by means of the natural Superfluities of Animals, to Coagulate and fix ☿, I am the rather inclined to Communicate the same to the World.

I will therefore in the name of God, for the good of Mankind, Communicate the way and Process. I my self at first made use of to Coagulate ☿, and that entirely from the Beginning to the End, and very plainly, not concealing any the least manual Operations. If any one from this Process here set down, chances to find out a nearer and better way, I shall be glad of it, we know it is much easier, to correct and meliorate a thing already invented, than to invent it. What I here set down my own hands have wrought, what I have never done or tryed I cannot write, but leave it to those, who are further advanced herein than my self.

A PROCESS.

TO fix ☿, by means of natural Superfluities into a true Tincture. ℞. Eight Ounces of Wool, Goats hair, filed Goats or Harts-horn, *&c.* dissolve any of these in a strong *Aqua Fortis*, at the same time dissolve, in an *Aqua Fortis*, that has been abstracted from decrepitated *Salt*, an Ounce of fine ☉, and two Ounces of ☿ in common *Aqua Fortis*, pour all these three Solutions together into a Glass Body, and abstract all the *Aqua Fortis* from the ☉ and ☿; this abstracted stincking Water pour again upon that, which remains in the Glass, and distil it off, repeat this Cohobation six or seven times, and the ☿ by this means will become united, and joyned to the ☉. This Conjunction put into a Glass Retort, and with a strong Fire drive the ☿ from the ☉, which will come over in the form of a thick red Butter, for the ☿ being so far fixed with the ☉, will not without great force be separated from it, especially when the Operator hath made use of a strong fixing Water, or *Menstruum*: However, by the violence of the Fire, he is at length forced to quit the ☉,

in which Separation he carries the Soul of ☉ over with him, which makes the *Mercurial* Butter to be of a red Colour; which *Mercurial* Butter, or Water being rectified doth dissolve ☉, and with it may be fixed into a true Tincture.

N. B. This *Solar* Butter may be another way without ☉ be fixed into a Tincture, not necessary to be set down here. He that hath a List to the work may begin with the Fixation, that is performed with the help of ☉. The ☉ and ☿ that remains in the Retort, may be recovered, as follows hereafter; for certain it is, that much of the ☿ in this Operation continues with the ☉, the Violence of the Fire having been unable to separate it, tho' it may indeed be done another way, whereby we are experimentally assured, that Animals have power so to bind the winged Youngster, as to fix him with ☉ into perfect Tincture, which Fixation would be easie, if the Horns and Hair of Animals did not for the most part turn to Coals, which do much hinder Fixation: For when the *Solar* Butter is by the force of Fire driven from the ☉, the Coals of the Hair stay behind with the Fire of ☉ and ☿: Which Coals may either, like other Coals, by means of our wonderful *Salt* be fixed into Tincture, for the ☉ and half fixed ☿ do not hinder, but rather further and help Fixation: Or else, we may joyn to these Coals, a due Proportion of good *Nitre*, and so make of them the always watchful, and Fire-spitting Dragon, and with the help of the *Narcotick* ♆ of ♂ and ♀ cast him into a dead Sleep, kill and fix him into Tincture. For we must know, that this Animal ♆ is incomparably better, than any Mineral or Vegetable ♆ of Stone, or Wood-Coal. Or else with the help of a fulminating Powder, we may separate the half fixt ☿, from the half disanimated ☉, by which means the *Nitre* kindles the Animal ♆ and consumes it, and then the ☿ being freed from the Bands of ♆ must come over, carrying over with it the yet remaining Soul or Tincture of ☉, which the ☿ in the Preparation of the *Solar* Butter did not bring over: Thus the ☉ becomes more disanimated, and the ☿ (which comes over of a fair Purple Colour) becomes the more richly animated, which Purple coloured ☿ impregnate with the Soul of ☉, may either by it self, be fixed into Tincture, or we may extract the Tincture with the Spirit of Wine, and make use of it as an inestimable Treasure in Physick. But the best way is, with our wonderful *Salt*, to fix these Animal Coals impregnate with ☉ and ☿ like other Wood-Coals into a tinging Carbuncle.

N. B. This wonderful *Salt* must be prepared of Oyl of *Vitriol* and *Nitre*. This is the way I have followed to Coagulate ☿ with ☉, by means of Animal Superfluities. I must own that it is a troublesome Work, especially because of the Stincks, one is obliged to take in. Some Philosophers indeed make mention of a nearer and easier way to obtain an Universal Medicine from Animals: Wherefore he that doth not like the Process, may seek for a better, which if he chanceth to light on, he has reason to bless God therefore, whose Gift alone it is.

A PROCESS, To Sublime the Coals of Sol, Mercury *and Animal* Sulphur *into Purple coloured Flowers, with the help of a fulminating Powder.*

SET a well luted Glass, or earthen Body in a subliming Furnace till it be red hot, then cast in so much *Nitre* as you think will be sufficient to kindle thy Coals with, and consume them, to which purpose, thou mayst put three times as much *Nitre*, as the quantity of thy Coals is. When thou seest that the *Nitre* is red hot and in Flux, then cast in upon the *Nitre* a piece of thy Coals as big as a Hasel Nut, and the *Nitre* will immediately kindle the ♆ and consume it, and by this means set the ☿ free; for in the burning away of the ♆, the ☿ is forced to leave the ☉, as not being able to endure so strong a Fulmination: And having by means of the Animal ♆, so intimately united with the ☉, as to be very hardly separable, but yet by the force of the *Fulmen* being fain to leave it, he in he in his flight takes the Heart of ☉ along with him, and brings it over in the form of a purple Sublimate, which with the Oyl of *Vitriol* (but much better by means of the universal Coagulator) may easily be fixed into a Tincture. This throwing of the Animal Coals upon the *Nitre*, thou must continue till all thy Coals be consumed, and so thou wilt obtain a ☿ impregnate, and tinged with the Soul of ☉, and the ☉ remains of a white Colour, being disanimated by the *Nitre*.

N. B. As oft as you cast a piece of your Coals into the Vessel where the *Nitre* in Flux is, you must immediately clap on the Head again, that the ☿ may not fly away, but be caught therein. For the said ☿ is a great Treasure, and may easily be fixed into a fusible Tincture. Thus you have the whole Process, how by means of Animal superfluities I have handled ☿ with ☉, and what hath been the Success of it: He who shall venture to set upon this Work and finish it, will find much more than I durst set down here.

The nearest and easiest way to fix these *Solar*, *Mercurial* Animal Coals into a Tincture, according to my Judgment is, First to fix the said Coals, by means of a Fixative *Sal Mirabile*: Or else, to mix them with a Volatilizing *Sal Mirabile*, and by Retort distil from them a good graduating Water; we may also add to these Animal Coals such a Fixative water, as is employed to kill and fix the watchful Dragon or *Basilisk*. Every one may choose of these several ways, what pleaseth best: And if any thing by reason of the shortness of time hath been omitted here, the same will be discovered to the Laborator in his Work, if God does not hinder it, whose Blessing is all in all. *Thomas Aquinas* had the Art in twenty four hours time, to prepare an universal Medicine from natural Superfluities alone, without any Addition of ☉ or ☿, without Charges, Labour or Trouble, without breaking of Glasses, and without taking in any loathsome Smells. So likewise *Avicenna*, *Albertus Magnus*, *Rhasis*, *Petrus Bonus*, *Joannes Lancinius Rupescissa*, had a much nearer and shorter way, than here we have described, as appears abundantly by their Writings. These Authors took their Subject and putrified it in Horse-dung, and then with the Element of Fire, they fixed the ☿ with the ☉ into a Tincture, in which Labour they were much troubled with the loathsome smell of the Matter. *Morienus* tells us, that the Matter when in Putrefaction, sends forth a stinck like to that which proceeds from Graves, for indeed there is nothing in Man, which doth not stink extreamly, when brought to Solution or Putrefaction. When we dissolve these Animal Matters with Oyl of *Vitriol*, this stink is not so great, as when they are dissolved with *Aqua Fortis*, the same also may be said of Spirit of *Salt*, when ☉, ☿ and Wool are dissolved in the same, and besides doth more Volatilize the ☉ in order to Sublimation, or Fulmination than *Aqua Fortis* doth. If

instead

instead of the Common ☿ we take a ☿ of ♄ for this Work, it will in Fulmination carry more of the Tincture of ☉ over, and the purple Flowers proceeding thence, are much more readily fixed by the universal Coagulator, than those that are made with the Common ☿.

What this universal Coagulator is, I have elsewhere declared, the great use of it is very evident, in that volatile Tinctures can hardly be fixed without it: For this Coagulator makes all volatile Corrosive *Metalline* Spirits fix so as to be able to endure the Fire, which without it require a long time. And therefore, he who doth not know it, or the use of it, must needs find the fixing of volatile Spirits very tedious and troublesome, whereas those that know the use of it, may perform more as to the fixing of Tinctures in three days time, than others without it can do in a whole Year. For there is nothing in Nature so Volatile, which this Coagulator doth not fix, as *Turba* testifies, saying that if God had not created our *Sal Armoniack*, all Chymical Labour would be in vain. Which indeed is the very Truth: For without a good *Sal Armoniack* it is impossible to extract the Tinctures from Metals and Stones, or to purifie and subtilize them to the highest Degree; and without preceeding Subtilizing, there can be no ingress into compact Bodies: For the more that any Tincture is Subtiliz'd and Volatiliz'd, the more readily, after Fixation, doth it enter all hard and compact Bodies. Wherefore if God had not created this Coagulator, these volatile Tinctures, how high soever they might be in Colour, would be of no use for the Transmutation of Metals. Thus we find, that in *Alchimy* these two principal Keys are extremely necessary: The first opens, makes Volatile, and Purifies and gives Ingress; the other binds and fixeth the Volatile, so as to make it endure the Fire, without which Fixation all Volatilization is in vain. O the Pains that I have formerly taken for to fix ☿, ☉, ♃ and other such like Volatile Metalline Spirits, whereas now it is most easie for me to do all this, and much more, with the help of my universal Coagulator, the knowledge and discovery of which must be fetched from the Principal Agent, or secret Fire of the Wise Men.

I cannot upon this occasion pass by discovering another Property that is found in our Animal Subject, *viz.* that it can in one distillation resolve all Metals, none excepted, into a running *Mercury*, which is a thing very wonderful, that fixt Gold and Silver should be so easily reducible to Volatile *Mercury*, seeing their Bodies are by nature kept in such strong bands. Of which Reduction of Metals to quick *Mercury*, no Person hath writ more clearly than *Basil Valentine*. The Ancient Philosophers have indeed writ much concerning the volatilizing of fixt Metals, but did never declare, that, by this Volatilization, they understood a reduction of them to running *Mercury*, for which reason this Art also hath been so little known. The Ancient Philosophers have recommended this volatilizing and fixing of Metals to us in these following Verses.

Fixum si solvas, faciasque volare solutum,
Et volucrem figas, faciet te vivere tutum.

Dissolve the fixt, and make it then to fly,
And fix the Fledge, and thou shalt dwell on high.

With these few words the Philosophers have declared their whole Work, but without any further explaining of them; so that the manner of compendiously volatilizing and fixing of Metals has been left in the dark. But because the end of this wicked World draws nigh, God is pleased to reveal these Secrets to some of his Chosen, which Talent mercifully bestowed upon me, that I might not be guilty of concealing, I have in the Seventh Part of my *Prosperity of Germany* at large set down the way to Meliorate the meaner Metals, with the help of Animal Salt Spirits, and that so plainly, that every one may understand it, and the Poor (if they will put their hands to the Work) may have abundantly wherewith to maintain themselves.

Moreover these Superfluities of Nature are endued with this power and property, that in one days time they can destroy fixt Gold, that resists all the Elements, so as to be no more *Sol*, but will suffer it self to be melted into a green fusible Stone, which is of wonderful force and virtue in all Metallick Operations, of which it is not needful to speak more at present. If God thinks fit to bestow this Green Stone upon thee, he will not suffer thee to be ignorant what use may be made of it. I cannot, upon this occasion, but communicate something that is very wonderful. As I was on a time melting some of this Green Stone in a Crucible, it happened to run through the Crucible into the Furnace, where some Silver was run out a little before, with which the Green Lion joyn'd himself; and when I came by fusion to separate my *Luna* from the Green *Sol* Stone, or my destroyed *Sol*. I found that my Green Stone had never been throughly united with my *Luna*, the Stone continuing still green without any the least alteration, but my *Luna* was become black and brittle like *Antimony*, and went away upon the *Cupel*. Now, what more wonderful change can be imagin'd than to see white fixt *Luna* changed into black volatile Lead? Upon occasion of this wonderful Transmutation one of the Philosophers cries out, as struck with admiration; *Nunquid Natura Retrograda?* What is Nature then turn'd Retrograde? Mind well this point, consider of it, and you will discover wonders; for when *Sol* is so far destroyed as to be no longer *Sol*, then the greatest wonders may be accomplish'd by it. Yet know, that it is no easie matter so to destroy *Sol*, that it shall be *Sol* no more; the Ancient Philosophers unanimously declaring, than it is easier to make Gold, than to destroy it.

N. B. This Green Gold-Stone being kept for some time in the Fire, becomes changed to a red colour, which is also of great use, he who desires to know more of it, may seek for it, as my self and others have been fain to do.

N. B. The *Salt* of the greater World (I mean Common *Salt*) changeth the Metals that lie in it for a long time, into a hard Stone, as appears from this instance; Some Fishermen here in *Holland*, lately took up from the bottom of the Sea some Blocks of *English* Tin, whose outside was turn'd to perfect Stone, the inmost part of them still remaining Tin; Who knows, how many hundred years this Tin had lain at the bottom of the Sea, before this change was made; but if the Sea *Salt* of the greater World can perform this in a long time, the Sea *Salt* of the lesser World can destroy Metals in a very short time, for our Animal *Salt* can do more in a few hours time, than the Sea *Salt* of the Macrocosme can do in an 100 years.

Wherefore I recommend to the Lovers of this Art to study the nature of *Salts* and their use, if they intend to perform any thing Extraordinary either in Physick or Alchimy.

N. B. The

N. B. The *Salt* of the Microcoſme hath alſo this property, that when it is put into *Aqua Fortis* it not only diſſolves *Sol* but *Luna* alſo, and is an excellent way to extract the Gold and Silver that is in Sand and Stones, concerning which Extraction I treat at large in the Seventh Part of the *Proſperity of Germany*.

N. B. Another virtue of this Microcoſmical *Salt* is, that it extracts the Tincture of Gold, and leaves the Body thereof white. And if we afterwards take this impregnate *Salt*, and extract the Tincture of Gold from it with Spirit of Wine, and burn away the ſaid Spirit under a Refrigeratory Helm or Head, then the Celeſtial Salt, or the Water of Life of the Philoſophers, will be conveyed into the Glaſs Receivers, and is very ſweet and pleaſant, but withal ſo ſubtil and volatile, that the Air attracts and ſnatcheth it away, if it be not immediately pour'd out of the recipients, and carefully kept in a cloſe ſtopt Glaſs.

N. B. At the bottom of the Cup or Diſh wherein the Spirit of Wine, impregnate with the Tincture of Gold, hath been kindled and burnt away, you will find the Tincture of Gold in the form of a Blood-red, pleaſant, fragrant, Aromatical Oil, which is true living *Sol*, and never ſtands ſtill, but is in continual motion, perpetually changing from one form to another. In a word, it is the true living *Sol* of the Philoſophers, which by Art is made of Common Gold, that is dead, which Living Philoſophick Gold, fragrant Dragons Blood, Incombuſtible Oil, and true Potable Gold is without doubt the higheſt Medicin that is in the World.

N. B. In the foreſaid manner we may alſo extract the Tinctures from *Mars* and *Venus*, as alſo from *Antimony* and *Sulphur*, and with the aſſiſtance of the flame of Spirit of Wine maturate them into moſt lovely, fragrant, incombuſtible Tinctures. For by means of our Microcoſmical *Salt* all Metals and Minerals may be reduc'd to Potability, without the help of any Corroſive, in which ſtate they are the moſt powerful Medicaments imaginable, to which the very beſt Remedies of the Galeniſts are not in the leaſt to be compared. But no Man ever attained theſe Secrets that was afraid to ſmut his Hands with Coals, or that was not earneſt in his Prayers to God for the diſcovery of theſe wonders; their Silk Clothes, Velvet Coats, Artificial Cant, and vain Ariſtotelical Philoſophy, cannot produce any ſuch effects, but the Fire alone which is the effecter and diſplayer of Wonders. Wherefore no Man can come to be a true Philoſopher ſave only by Fire, which alone hath the power to remove that which is evil, and to manifeſt and bring to light the inward concealed Good, which is true in an Earthly as well as Heavenly ſenſe. I repeat it once more, that he, who doth not know Fire, and its hidden Divine Virtue and Operation, is a pitiful Philoſopher, and doth not at all deſerve that Title, for the Light is hid from him, and conſequently all Nature appears vail'd and dark to him; which matter I have treated of at large in my *Celeſtial and Terreſtrial Purgatory*.

Beſides all that hath been ſaid already, many other great, yea incredible, things may be performed with the help of Animal Excrements and Superfluities, and in particular the extraction of Silver and Gold out of Sand, Stone and Poor Oar, that is not worth the melting, as ſhall be at large declared in the Seventh Part of my *Proſperity of Germany*.

It may be ſaid with truth, that never yet did any Man find out all the Virtues that are contained in theſe Superfluities of Nature, they being indeed greater than can be believed, which is the reaſon, why the Philoſophers would never call theſe contemptible and loathſom Subjects by their own names, but have covered and concealed them under Metaphors and Allegories, that the great ſecrets contained in them might not be proſtituted to the Proud unworthy World.

I do intend, God willing, with the firſt occaſion to treat more at large concerning the nature and uſe of theſe Animal Superfluities in the Seventh Part of the *Proſperity of Germany*, where I ſhall, amongſt other things, demonſtrate, that theſe Superfluities of Nature are not only able to exalt *Sol* and *Luna* in their colours, but alſo to augment them to infinity in quantity and quality; I ſhall alſo plainly diſcover the way, how from Sand and Stone and the meaneſt of Metals, Gold and Silver may be extracted, ſo that every one, that is but little acquainted with the managing of Fire, may, with little charges in his own Houſe, entertain and keep going a profitable and rich Mine of Gold and Silver, for the comfortable ſupport of himſelf and family, to which God be pleaſed to grant his Grace and Bleſſing, *Amen*.

FINIS.

THE INDEX.

In which P, with the Addition of 1, 2, or 3, signifies the first, second, or third Part; *a* the first Column of the Page, *b* the second Column; and where neither *a* nor *b* occurs to the number of the page, the matter is obvious in that page by the Contents, or otherwise by the matter being treated of in all, or the greatest part of the page.

A

ACetum *of Philosophers, like to their* Sal-Armoniack, *both having their rise from Common Salt*, Part 3. page 33. b.

Adam *brought the first matter of the Philosopher's Stone out of Paradise, and again carried it to his Grave*, P. 2. 72. b. *Divers particular Transmutations of Metals, by the help of this Microcosmical subject*, 74. b.

Aurum Fulminans *to prepare*, P. 1. 23. b. *Being fired upon a Plate of Metal, tingeth it so that it will abide the Touch-stone*, 75. b. *How to take away its fulminating quality*, 416. b. P. 2. 39.

Aurum Diaphoreticum *to prepare*, P. 1. 385. *Its Use and Vertues*, 386. a.

Air *hindereth the fixation of any subject by the fire*, P. 1. 200. a.

Alchymy *what, its Agents are Fire and Salt*, P. 2. P. 1. 410.

Alcaheſt *corrects all poysonous Vegitables, Animals, and Minerals*, P. 1. 108. *Its Vertues in Metallicks*, 110. *Its Preparation*, 153. *Its Use*, 153. 163. *It dissolves all Stones, and even the very Glasses in which Solutions are made*, P. 2. 102. b.

Allom *its moist fire to prepare*, P. 2. b.

Amber *to purifie by distillation, and again to congeal it into a transparent hard lump*, P. 2. 64. a. P. 1. 73. a.

Aurum Mosaicum *or Musicum to prepare for Limners*, P. 2. 68.

Animæ *of Vegitables commended to Physicians*, P. 1. 191. a. *being conjoyned with the* Animæ *of Minerals, are an excellent Medicine*, ibid. *They are the Rays of the Sun coagulated*, ibid.

Anima *of Antimony and Gold, rubefie* Lune, *and make it a Tincture*, P. 2. 69. a.

Anima *of Gold to extract*, P. 1. 204. b.

Animals *poysonous to prepare into good Medicines by the Universal* Menstruum, P. 2. 97. 101.

Antidote *against Poyson*, P. 2. 23.

Antimony *well prepared is never given in vain*, P. 1. 42. a. *How to prepare it to* purge *onely downward*, ibid. *Its superfluous* Sulphur *to separate*, 78. *Antimony by long digestion, much of it becometh* Gold, 43. b. *Antimonial* Wine *or* Beer *to prepare of excellent Vertues*, P. 1. 42. b. 43. a. *Antimonial* Cup, *its Preparation and Use*, 92, 93. *Antimonial* Flowers, *Emetick and Diaphoretick to prepare*, 8. a. 105. *A* Universal Medicine *prepared of them*, 106. *Its Vertues, Use and Dose*, 107. *Antimonial Flowers how reduced into* Regulus *with its Uses*, 110, 111. *Antimonial* Clyssus *to prepare*, 296. Regulus *of Antimony to prepare*, 78. a. *Antimony reduced into a* red Oyl *or* Panacæa *without distillation*, 44. a. *Antimony or Sulphur so* to ripen *that they may acquire Odours like Vegitables*, 51. *Antimony contains much spiritual Gold*, P. 3. 43. b.

Antimonial Sulphur *to separate from its* Mercury, *and to make its Mercury into a* Panacæa *for the curing of all diseases*, P. 2. 28. *Antimonial* Purge *in all grievous diseases, to prepare*, 59. *Antimonial* Panacæa, *its Preparation and Use*, 107. a. *History of a wonderfull Cure wrought by it upon a Child*, 109. b. *It is a true Remedy against the* Scurvy *both by Sea and Land*, 110. b. *A* Chyrurgeon *on* Ship-board *or in a* Camp *may cure and preserve more Men with one single Ounce of this* Panacæa *than with a large Chest of Common Medicines*, ibid. *Golden* Panacæa *of Antimony how prepared*, 133. b. *Of* Antimony *and Silver, a good Medicine to prepare*, ibid. Antimony, Arsnick, *and* Orpiment, *as also the Sulphur of Vegitables to* fix *by* Lutum Sapientiæ, 167. *Antimonial* Emeticks, *to make work downwards onely*, P. 3. 65. b.

Apoplexy *cured by the volatile Spirit of Vitriol*, P. 1. 17. b.

Aurum Potabile, *its Preparation, Vertues, and Use*, P. 1. 97, 98, 99. *The Authour's white* Aurum Potabile *exceeds the former*, P. 2. 133. a. *How prepared*, ibid. b. P. 1. 219. *His Defence of his true* Aurum Potabile, P. 1. 243, 244. *Its Nature, Form, Properties, and admirable Vertues*, 208. *Experiment of its power in promoting the growth of Vegitables*, 209. *Description of its outward form*, 211. b. *It* transmutes *Common Mercury, and other Metals, into Gold both by the dry and wet way*, 211, 212. *It* tingeth *Sand into Gold*, 216. b. *Its Vertues and Use in Medicine*, 213, 218. b. *It* Gildeth *Silver by the help of* Argentuive, 245. a. *It changeth* Mercury sublimate *into a Red Powder, gently purgative and Diaphoretick*, 243. b.

How with Aurum Potabile *to make a Ruby or Hyacinth*, P. 1. 217. b. *How to change the Colour of this* Aurum Potabile *from white to red*, 220.
Another Aurum Potabile *to prepare*, P. 2. 167.
Aqua Fortis *to prepare*, P. 1. 29. a. *It differs little or nothing from Spirit of Niter*, 29. b.
Aqua Regia *to prepare*, 23. b. Aqua Fortis *and* Aqua Regis *to prepare in plenty for the dissolving of Metals*, P. 2. 13, 14. 66. a. P. 1. 425, 426. Aqua Fortis *at one distillation transmutes half its weight of Common Salt into Salt-peter*, P. 1. 415. b.
A Golden Aqua Vitæ *to prepare, the like never described by any*, P. 2. 150.
Aqua Saltaberis *of* Paracelsus *fixeth and rubefieth all white Mercuries*, 190. b. Helmont *erred in taking it to be the water of Whites of Eggs*, ibid.
Arcanums *to discover is very injurious*, 148, 190.
Arsnick *and Orpiment to fix*, 162. *When fixed they tinge Copper white like Silver*, ibid. Arsnick *its nitrous Spirit to prepare*, P. 1. 30. *It graduateth Copper white as Silver, and malleable*, ibid. *Arsenical quality taken away from Mineral Oyls by Spirit of Salt*, P. 2. 152. a.
Arms *and* Armour *to preserve from Rust*, P. 1. 182.
Of Arsnick, 319, 320.
Artificers, *as Engravers, Painters, Dyers, Statuaries, and many others, may be benefited by the Authour's Labours*, 165. a.
The Astral Beams *penetrate to the Center of the Earth, and what they operate*, 117. *How they beget the* Central Fire *of the Earth*, 119. b. Astrums *of the Metals, what*, 367. b.
The Authour *was so renovated in his old Age, as to have new black curl'd Hair, by the taking a small quantity of a certain Tincture*, P. 2. 204. a. *He complains that his Writings and Secrets brought him many troubles*, P. 1. 170. b. 172. b. *He never gained one half-peny by his Writings*, P. 2. 186. a. *He hath borrowed nothing from other Writers, but hath attained all his Secrets by his own Labours*, 71. a. *He wasted some pounds of Gold unprofitably in his younger years, in seeking for a Tincture, and finding a safer way for others*, P. 3. 12. a. *He was wronged by his Servants and Courtiers*, P. 2. 148. b.
The Authour's *opinion that the Stone of Philosophers may be made of Common Salt*, P. 1. 269. a. *He sowed Grain in bare Sand, and had it sooner ripe, than the same sowed in good Earth*, 388. a. *He had a Patent from the States of* Holland *for the improving of barren Land*, ibid. *He laments his being too liberal in the communicating of Secrets*, 223. a. *His being Calumniated, hath been the occasion of his more open publishing of his Secrets*, 210. b.
The Authour's *account in what order he published many of his Works*, 248. a.
Of Azoth *and* Laton, *or the Agent and Patient of Philosophers*, P. 1. 396. *The* Authour *attaining to the knowledge of this* Agent *or* Secret Fire *of the Wise, laid aside Furnaces, Glasses, and Coals*, P. 3. 61. a. 62.

B

BAkers *or* Brewers, *how they may supply the want of Yest or Barm*, P. 1. 182.
A Mineral Balsam *of Sulphur of exceeding great Vertues*, P. 2. 126. b.
Balsam *of Roses, and other Vegitables, consisting of their three Principles purified and again conjoyned*, P. 1. 60, 61. a.
Barrennes *in Men or Women to cure*, P. 1. 266. a. 267. b.
Baths *of Common water* 63. *Of Sulphur* 65. *Of the Dry* Bath *or Sweating Chair*, ibid. *Whence the heat of natural hot* Baths *ariseth*, P. 2. 114. b.
An efficacious Bath *for the curing of many diseases*, P. 1. 189. b.
Of the Beetle *or* Scarabæus, *the horned and Bull-like, also the round or Globular, their Signature, Properties, and Medicinal Vertues*, 94. *Hens feeding on the gray* Beetles *lay faster than those which are fed with Corn*, P. 2. 95. b.
Bezoardicum Minerale *to prepare, with its Vertues*, P. 1. 8. b.
Beer, Ale, Wine, *or* Metheglin, *to strengthen*, 159. *Being sowr to recover them, and render them drinkable*, 159, 182. *To preserve them in Summer from the fret*, 286. a. *Beer to make with Honey, which will keep ten or twenty years*, 286. a. Beer *or Ale may be made in the hottest Climates, or Weather, of Concentrated Corn, where Water and Hops are at hand*, P. 1. 305. a. *The Excellency of* Beer *so brewed, beyond the Common*, ibid. b.
Birds *so to intoxicate that they may be taken with ones hand*, P. 2. 154. a.
Birdlime *so to prepare, as not to be altered by heat or cold*, P. 1. 182.
Bleeding *immoderate of any kind, to stop*, P. 2. 149. a.
Blood-letting *not available in curing of rooted and stubborn diseases*, P. 1. 245. a.
Borax, *its Water turns Lead into Quick-silver*, P. 1. 236. a.
A Delicate Bread *to prepare*, P. 2. 58. b.
Butter *to make by the help of Spirit of Salt, which will keep long good*, P. 1. 380. a.
Brandy *to distill from the Lees of Wine*, 292. b. *To make* Brandy *of all sorts of Corn, and to give it a relish like that made of the Lees of Wine*, 158, 159. 166. b.

C

CAbinet-makers *may make Pear-tree or Cherry-tree to be like Ebony*, P. 1. 180.
Excellent Cheese *like Parmasan to make by the help of the Spirit of Salt*, P. 1. 364. b. 379. b.
To kill Worms, and prevent holes in Cheese, 380. a.
Childrens *being gauled with their Urine, to help*, 13. a.
Chrystal *to tinge with various Colours like pretious Stones*, P. 2. 65. a. P. 3. 56. a.
Chrystals *to dissolve in a certain Menstruum, with their Vertues*, P. 1. 248. a. P. 3. 55. b.
Chrystals *or Cream of Tartar to prepare*, 38. b.
An Elegant Cinaber *graduating* Lune *into* Sol, P. 1. 374. b. N. B.
Collick *to ease*, 40. b. 54.
To Colour *Hair, Bones, Feathers,* &c. *brown or black*, 40. a.
Colours *for Painters, as Ultramarine, blue Smalt, Scarlet Lacca, Venice Ceruss,* &c. *to prepare*, 179. Smalt *to make, as beautifull as* Ultramarine, P. 2. 68. a.
Coals *afford a sweet Mineral Oyl*, P. 2. 125. b. 126. a. *How it is to be distilled and rectified*, ibid. *It is equal to the Oyl of Peter*, ibid.
The four Complexions *described*, P. 1. 388. a.
Confection *of Alchermes Mineral, to prepare*, 384.
Copper *to extract and render Corporeal, from such poor Oars as will not defray the charge of melting*, P. 1. 326, 327. P. 2. 18. P. 1. 293, 420, 425. *Copper to transmute into Verdigrease*, P. 2. 18. *Into other Colours for Painting*, 16, 77. a. *Gold and Silver to*

separate

ſeparate from thoſe Colours, 17. *Copper diſſolved in* Aqua Fortis *mixt with Silver, Iron, or* Lapis Calaminaris, *to reduce and render malleable*, 42.
Copper *to make white as Silver, and graduate into Silver, yielding Gold*, P. 2. 68. b. P. 1. 419. *To graduate into Gold by a Cement*, P. 2. 68. P. 3. 71.
A Cordial *to prepare, to be uſed in great and continual diſeaſes*, 115.
Corn *of all ſorts, how to be prepared, before its Spirit be diſtilled*, P. 1. 57.
Corn *to concentrate for the making both Bread and Drink on Ship-board in caſes of neceſſity*, 277, 278, 296, 302.
Corns *of the feet to take away*, P. 1. 181, 288. a.
Corroſives, *as Oyl of Vitriol*, Aqua Fortis, *&c. to dulcifie*, 405. b. P. 2. 68.
Crocus Martis *to prepare, with its uſe*, 328. a.
Crucibles *to make, which will long endure the fire, with Lead*, 69. a. 199. b. P. 1. 90.

D

DAy *and Night, Light and Darkneſs, what*, P. 2. 86. b. 87. a.
Death, *what it is*, 86. b.
Decoctions *of Herbs of no value in Phyſick*, 113. a. *Their Decoctions in the Alcaheſt, or firey water, much to be eſteemed*, ibid. b.
Demogorgon *perfects all Metals, both within and without the Earth, and is the ſecret Fire or proper Agent of Philoſophers*, 69. b. *It makes* Saturn *hard, and white as* Lune, *as it becomes crude out of the Earth*, ibid. *It makes Copper white, and hard as Steel*, ibid. *It makes* Lune *through black, and* Sol *exceeding hard*, ibid. *It makes excellent Looking-glaſſes*, ibid. Demogorgon *deſcribed*, P. 3. 58. a.
How Dyers *may give ſuch a ground to their Cloth, that the Colours ſhall not be corrupted by Air, Sun, Vinegar, Urine*, &c. P. 1. 180.
Diocleſian *could not overcome the* Egyptians *till he had cauſed all their Books to be burnt*, 185. b.
To Diſtill *Spices, Seeds, Roots, Herbs, Flowers*, &c. *by the third Furnace*, 59.
Diſtilling *Inſtrument deſcribed for the plentifull making of acid Spirits, and the eaſie extraction of Metals from their Oars*, 429, 430, 431.
A Diuretick *and Nephretick extract, of excellent Vertues*, P. 11. 112.
Drink *very like to Wine, to make of Grain and Fruits*, P. 1. 167. a.
Dropſie *cured by the irreducible Blood of Gold*, P. 3. 286.
A Dream *may bring a man knowledge*, P. 2. 145. a.
Men made Drunk *with a very ſmall quantity of the Spirit of Tobacco or Henbane*, 154. a.
Drunkenneſs *to prevent, and its Evils to cure*, P. 1. 289. b.
Dungs *of various uſe in Phyſick*, P. 1. 248. b. Dung *fattens the Earth onely by its nitrous Salt*, 169. a. *Humane* Dung *makes Flowers grow, but gives them an ill ſmell*, P. 2. 125. b. *Humane* Dung *to render ſweet and Medicinal*, 159. b.

E

EArthen *Veſſels to Glaze*, P. 1. pag. 92.
Electuary *compounded with Spirit of Salt, its manifold vertues*, 287. a.
Separation of the Elements *from the* Chaos *deſcribed*, 255. a.
Elias *the Artiſt, what*, P. 1. 222. a. 350. a. P. 3. 52. a.
Elixir Proprietatis *to prepare, with the volatile Spirit of* Mars, P. 2. 152. b. *Its uſe and manifold vertues*, 153. *It preſerves both quick and dead*, ibid. Elixir Proprietatis *to prepare with Secret* Sal-Armoniack, 179. b. Elixir Proprietatis *far tranſcending that of* Paracelſus *or* Helmont, P. 3. 57. b.
Embroiderers, *how they may put durable Colours upon their Silk*, P. 1. 179.
Enamels *or Colours for Glaſs, to prepare*, ibid.
Enemies *to repell or take Captive without ſhedding of blood*, 431. b. 437. b. 439.
Engravers *and Statuaries Tools to harden*, ibid.
Epilepſie *or Falling-ſickneſs, to cure*, 16. b. 17. b. 21. a. 50. b. 53. a. 63. a. 265. b. *The cauſe of the* Epilepſie *not known*, 238. b.
Epiſtle *to the Authour complaining of his writing too openly*, P. 1. 421.
Eyes *inflamed, the cure*, P. 1. 13. a. 39. b. 237. a.
Eryſipelas, *the cure*, 50. a. 288. a.
Eſſences *of Vegitables to prepare*, P. 2. 84. Eſſence *of Aſh-keys, an excellent Medicine to diſſolve the Stone*, 88. b. Eſſence *of St.* John's *Wort, cures Wounds, Bruiſes, Obſtructions of Liver and Spleen*, ibid. Eſſences *of Tobacco and Henbane, heal diſeaſes of the Womb*, ibid. Eſſence *of Roſes and Cinamon, a great refreſher of a languiſhing nature*, ibid. Eſſence *of Wine*, 91. a. Eſſence *of Pearls, Corals, and Stones*, P. 3. 57. a.
Extraction *of Pearls, Corals, Crabs-eyes*, &c. P. 1. 44.
Extract *Vomitive*, 61. *Purging*, 62. *Diaphoretick*, ibid. *Diuretick*, ibid. *Somniferous*, ibid. *Cordial*, 63. *Odoriferous*, ibid.
An Extract *of Corn of light Carriage, which may at any time be made into Beer, or uſed inſtead of Bread*, 184.

F

FArner's *Obligations to the Authour, for the keeping of Secrets communicated*, P. 1. 149.
Fevers *not to be cured by cooling Remedies*, 167. a.
Feathers *to dye of any Colour, conſtant and durable*, 180. P. 2. 149. a.
Tht Feathers *of Eagles and Doves to prepare, for volatilizing Menſtruums*, P. 2. 170.
Fermentation *of the Authours new*, P. 2. 219. a. *Of his Secret* Ferment, ibid.
Fire *common, its Excellency*, 115. a. *Its knowledge the firſt ſtep to the underſtanding of many Arcanums*, ibid. Fire *to extract out of any Wood or Herb whatſoever, and render it palpable and viſible*, P. 2. 7. Fire *to kindle into a flame from two clear Liquors*, 2. Fire *of the Vine to extract*, 8. Fire *to extract and concentrate out of Animals*, ibid. Fires *of Salts concentrated effect wonders*, 19. *Their particular Medicinal uſes*, 23, 24. *They can doe more miſchief in War than Gun-powder*, 217. P. 1. 431. b. 437. b. *Secret Fire or Agent-ripening Metals*, 400. P. 3. 77.
Fires *various and unheard-of, with their Uſes*, P. 2. 216, 217, 218. P. 3. 64.
The Secret Fire *of the* Chaldeans, *of what prepared*, P. 2. 69. a.
Fire *of the* Maccabees, *what*, 114. b. *It joyns Gold and Silver*, P. 3. 64. 8.
The Secret Fire of Philoſophers, P. 2. 144 b. 219. *It is called by three Names, but is either Oyl of Vitriol*, P. 3. 20. a. *or Oyl of Vitriol coagulated*, P. 2. 184. b. *It totally* fixeth Mercury *into a Red ſweet Tincture without any diminution of its weight*, 193. a.
The Fire of Artephius *draweth out the higheſt power or* Quin-

Quinteſſence of Animals, Vegitables, and Minerals, without common Fire, Furnaces, or Glaſſes, and without Labour and Coſt, P. 3. 48. a. *Its Preparation*, 62.
A Purgatory Fire *which ſweetens and purifies all Vegitable, Animal, and Mineral Subjects*, P. 2. 159.
The three Principal Fires *enable a Phyſician to prepare variety of Excellent Medicines againſt all diſeaſes*, 160. b.
Mineral Fires *to extinguiſh by the* Vegitable, *and their corroſiveneſs converted into ſweetneſs*, 158.

G

GAleniſts *err in their adminiſtring Gold and pretious Stones*, P. 2. 198. b. 199. a.
Gangrene *cured by Spirit of* Sal-Armoniack, P. 1. 50. a.
Gardens, *or Orchards to keep out Deer, Swine or wild Beaſts*, 192. a. *To rid them of Worms and other Inſects*, 181. *To prevent Spiders and other Inſects from creeping up Fruit-trees*, 9. b. 192. a.
Gems *or pretious Stones to amend their Colours*, P. 3. 50. a.
Gems *or Artificial Stones to make of various Colours*, P. 1. 82, 83. 412, 413. a. *A Ruby or Emerald*, 248. b. *or Hyacinth*, 217. b. Granats *to change into Rubies and pale Hyacinths, and other white Stones to exalt in their Colour*, P. 2. 212. b.
Glaſſy *Colour to prepare like the Indian Porcellan*, P. 1. 180.
Glaſs *of Copper red, fit for the tinging or painting of Glaſs*, 135.
Glaſs *of Antimony to prepare eaſily*, 14. a. Glaſs *of Lead for the fluxing of Tin Aſhes, to prepare*, 39. 112. Glaſs *is the Philoſophers* Lutum Sapientiæ, P. 2. 167. a.
Glaſſes *to gild durably with the Colour of Silver*, P. 1. 391. b. Glaſſes *to hold volatile and ſubtile Spirits*, 87. *The way of grinding Glaſs-ſtoppers*, ibid.
Gold *living, how it differs from the dead*, P. 2. 131. *Of its preparation and diſſolution into tender Atoms, fit for Vivification and Medicinal uſe*, ibid. 139, 140. *How thoſe Atoms are to be further opened and made volatile like a Vegitable*, 131. *How the Stomach may be aſſiſted ſo that it may diſſolve* Gold, 132. Gold *when exanimated, flies the fire like Arſnick*, 72. a. *The Medicinal Carbuncle of* Gold *to prepare*, 51. *The Tincture of it ſwiftly promotes the growth of Vegitable Seeds*, 52. Gold *to be exalted in the Mineral* Aries *by the Secret* Sal-Armoniack, 189. a.
Gold *not to be reduced into three Principles*, P. 3. 26. a. *nor to have its Colour extracted by Salts, for the Tinging of* Lune; *but to be reſolved by putrefaction, and made irreducible*, ibid. *How this is to be done*, 27. a. *after a Total blackneſs*, 27. a. *ariſeth the* Peacock's tail, *and* Dragon's blood, 28. a.
Gold *its Tincture, with its Uſe*, P. 1. 26. a. *Another Tincture of* Gold, *or* Aurum Potabile, *with its Vertues*, 265. *It turns a Needle or pure Iron Wire into fine* Gold, *by digeſting in it*, 267. b. Gold *with Silver to prepare into a fuſile purple Stone*, 384. *To ſublime into a Red Medicinal Salt*, P. 2. 168.
Gold *may be gotten out of every Herb*, P. 1. 374. b. *Demonſtrated by the Authour in the preſence of many learned Men*, P. 410. a. 412. b. Gold *diſſolved in a Corroſive, and the Corroſive dulcify'd, becomes a Liquor, which may ſerve for an* Aurum Potabile, *and gilds Quickſilver, and other Metals, with a Golden Colour*, 386. b. Gold *to generate in* Saturn, 397. b. *To conjoyn with its Capital enemy Sulphur, and with* Lune, 398, 399. Gold *volatile in ſome Oars and coloured Flints, may be diſtilled into a gradatory Water, tranſmuting Mercury into Gold*, P. 1. 426.
Gold *and Silver to purifie, and ſeparate from each other*, P. 1. 147. a. 331. b. *by Melting onely*, 175. Gold *to ſeparate from the imperfect Metals and Minerals onely by melting in a Crucible*, 177. Gold *to ſeparate from the imperfect Metals*, 145, 146. a. *Gold and Silver to get out of old Tin or Pewter Veſſels, the Tin or Pewter being preſerved and amended*, 176. Gold *impure to ſeparate and purge by Antimony*, 104.
Gold *to extract with profit from* Flints, Sand, Clay, *&c.* P. 1. 101. 371, 426. P. 2. 76. *An infallible way of proving whether they hold much or little Gold*, ibid. *As alſo out of* Granats, Agaths, Saphires, Rubies, Red Talk, *&c. which will not yield either to Lead, or ſharp Waters, and to reduce it to a body*, P. 1. 422, 423, 426. P. 2. 12, 15. Gold *to extract out of any Copper*, 17, 18. *Out of natural Vitriol*, ibid. 65. b. *Out of Sea-ſalt*, 18. *Out of poor Lead Oar*, ibid. *Out of all rude and ſtubborn Metallick Earths*, 19. 67. Gold *and Silver Marchaſites, how to get more Metal from them, than by the common way of Melting*, P. 1. 172. *How to fix them in three hours ſpace, ſo that they ſhall yield a double quantity of Metal to what they would have done before*, 175.
Gold *to make out of Silver with profit, and Gold and Silver to ſeparate after a peculiar manner from Iron, Copper, Tin and Lead*, P. 3. 46. Gold *to ſeparate from Iron or Copper by the Glaſs of Lead*, P. 2. 40. *From* Regulus *of Antimony without looſing the* Regulus, ibid. *From Copper*, 43. *From Arſnick*, P. 1. 321. Gold, *Silver, and Copper to extract from poor Oars, by* Aqua Fortis *or Spirit of Salt*, P. 1. 360, 415, 425, 426, 427. *The ſame may be done with the Water of Salt, or Salt-peter, acuated with the Oyl of Vitriol*, ibid. *How to precipitate, and reduce the extracted Metals*, 416. Gold *to augment by the imperfect Metals*, P. 1. 178, 361, 362. Gold *and Silver to ſeparate from each other, by a cheaper way than the common*, P. 2. 194. *and both from Copper*, 217.
Gout *Pains, ſuddenly to eaſe*, P. 1. 37. a. 288. a. *Its Knots to diſſolve*, 50.
Gout *to cure*, 265. b. P. 2. 24. b. 58, 59. P. 3. 28. b. *Many Gouty perſons cured in a few years by the Golden* Panacæa *of* Antimony, 110. b.
Gonorrhæa *to cure*, P. 2. 149. a.
Gravel *to expell*, P. 1. 37. a.
Grapes *to have ripe ſooner than ordinary*, 183. Grapes *dried, or Raiſons how to recover their ſweetneſs, as when pluckt freſh from the Vine*, 284. b.
Griffin *Phyloſophick generated of the Lion and Eagle*, 356. a. 406. b. 407. a.
Gunpowder *found out by a* Monk, *Anno* 1380 433. a. *The Authour thinketh the* Monk *did ill to divulge it*, ibid. b. *He ſpeaks of another way to captivate Enemies without killing them*, ibid.

H

HAir *to Dye, as alſo Skins, Wool, Bones, with a purple or red Colour, conſtant and durable*, P. 2. 149. a.
Hens *delight in Salt, which makes them lay the more Eggs*, P. 1. 169. a. *They devour Sand and ſmall Pebbles for the matter of Egg-ſhells*, 284. a.
Quick Hedges *to cauſe to grow up in half the uſual time*, 191. b.
Herbs *to make grow up in a few hours ſpace*, P. 1. 200 b. P. 3. 59. a. *To communicate to them the nature of any Metal*, 210. a. Herbs *various and unknown, to produce without Seed*, 257. b. 289. a. P. 2. 49. *The great*

great errour of Galeniſts, *in attributing the ſame vertues to* Herbs *in thoſe Northern Climates, as were aſcribed to them in the Southern*, 217. a. *The* Herbs *of cold Countries may be rendred equal in vertue to thoſe of hot, by the Terreſtrial Sun and Art*; 217. b. Herbs *to diſcover by an experiment, whether they are profitable or unprofitable in Medicine*, P. 2. 23.

Hiſtory *of Gold made out of Sea-Salt*, P. 1. 412. a Hiſtory *of an Infant preſerved from Corruption many years, in a certain Water, and at length turn'd into a Stone*, 260. a. Hiſtory *of a Mountebank at* Paris, *kill'd by the Odour of a ſpirituous or volatile Poyſon*, P. 2. 85. a. Hiſtory *of a Country-man to whom a Doctor had preſcribed* Album Græcum, 159. a. Hiſtory *of* Sigiſmund Wan, *who built a Church and Hoſpital by Wealth obtained from ſeparating the Gold and Silver from Tin*, 201. a. P. 1. 371. b.

Hony *to Ferment before the diſtillation of its burning Spirit*, P. 1. 58. *To take away its ungratefull Taſt, and purge it from its hidden Impurities, ſo that an excellent Drink may be made of it, for ſmall charge, ſerving inſtead of Wine*, 286. a. P. 2. 56. *Or a Metheglin with Spices*, 57. a.

Hops *to produce in plenty*, P. 1. 191. b. *To preſerve the Hop-poles in the Earth, long from rotting*, ibid.

Horns *to ſoften, ſo that any Image may be printed upon them*, 182.

Hovels *of Grain, to keep Rats and Mice from running up the Poſts*; 192. a.

I

IRon *to graduate into Gold by a Fulmen*, P. 3. 71. N. B. *By* Sal-mirabils, P. 2. 49. *To exalt it into Copper by the ſame*, 58. *All Iron contains Gold, both fixt and volatile*, P. 1. 375. *An eighth part of* Iron *changed into Gold*, P. 1. 230. a. Iron *to change into Gold, Silver, or Copper, by a Fulmen*, 230. b. Iron *to change into Copper according to* Paracelſus, 240. a. 293. b. Iron *Tools changed into Copper, by length of time, in Mines of Vitriol*, 229. a. 234. b. Iron *to ſeparate from Copper*, 326. b Iron *made as fuſile and malleable as Copper*, P. 1. 375. a.

Jupiter *and* Venus *beget* Apollo *and* Diana, 401. b.

Itch, *or Scab, to cure*, 364. b.

L

LAnd, *poor and barren*, to enrich *without Dung*, P. 1. 187, 189, 191, 193. b. 200. b. 405. a 417. a. P. 2. 33. *This Manure holds good twenty years*, ibid. *The manner of preparing this* Manure *of Common Salt and Lime*, P. 1. 416.

Lead *Oar, Courſe and not meltable, how to extract the Lead from it*, P. 2. 18. Lead, *or any Lead Oar, to reduce into Aſhes, and thence to extract Gold and Silver*, P. 1. 399. a. 414. P. 2. 36.

Lead *eaſily ſeparated from its Oar, by adding Iron in the melting*, P. 1. 74. a.

Lead *to amend by the graduating Extractions of coloured Flints*, P. 2. 37. *How to reduce the Calx of Gold precipitated from the Lead, and waſhed, without any loſs*, 38, 39. *Of the nature and property of* Lead, 198. *It contains a ſharp Sal-nitrous Spirit*, 199 Lead *to make hard like Iron, ſo that great Guns may be made of it*, 199. b. *The inward juice of* Lead *is ſweeter than any Sugar*, P. 1. 381. b. *A white precipitate of* Lead *to prepare*, 382. a.

N. B. Lead *hath the power of dulcifying Corroſives, and thence grows ſo penetrant, that it will preſently run through three Crucibles one in another*, P. 2. 200. a. *To make it hard and white like Silver*, P. 3. 89. b.

A red Stone of Saturn *and* Mars *to prepare, with its manifold Vertues in Phyſick and Chyrurgery*, P. 1. 382. b. *It is the true* Lapis Hæmatitis *of the ancient Phyſicians*, 383. a. *The red Sublimate aſcending in this operation, is able by Sympathy, to cure at a diſtance, any Flux of blood whatſoever*, ibid. *A white Stone to prepare of* Saturn *and* Lune, 383.

Black Lead *of Philoſophers, what*, P. 2. 217. b.

Leproſie, *to cure*, P. 1. 265. b.

Leather *to make black*, 180. 364. b.

Linnen *Threads to make ſo ſoft, as to emulate Silk*, 180.

Looking-*Glaſſes and Burning-Glaſſes, to make*, P. 1. 79. *The Metallick mixture for the ſame*, 80. *The manner of ſmoothing and poliſhing them*, 81.

The Ludus *of* Paracelſus *prepared by the Authour, with his* Alcaheſt *or ſecret Sal-Armoniack, for the* Stone, p. 2. 180. 6.

Lune *to graduate into* Sol *by a ſingular Spirit*, 68. b.

Lutes *for the building of Furnaces, joyning of Receivers, and for broken Glaſſes*, p. 1. 86.

Of the Lion *or Lions blood, how to be prepared, and uſed in Medicine and other Arts*, p. 2. 149. *It cures the* Leproſie *and* Pox, Ibid.

M

MAdneſs *and Melancholy hypocondriack, the cure*, P. 1. 176.

Magiſtery *of Pearl, Coral, &c. to prepare*, 18. b. *The abuſe uſed in thoſe Preparations*, ibid. *Of Egg-ſhells, with its vertues*, P. 3. 57. a.

Magneſia *is rich in a Metallick Tincture*, P. 1. 353. *How to prepare its Tincture with Alcohol of Wine*, P. 3. 56. *An Univerſal Medicine of it to prepare, with its uſe*, P. 2. 150. P. 3. 33. *With the Secret Fire of Philoſophers*, 39. b.

Magnetiſm, *its admirable Power in attracting its like*, P. 2. 29.

Magnetiſm *of Metals, Salts, and Stones*, P. 1. 342. P. 3. 40. a.

Magnet *to attract a Univerſal Medicine or Mercury from the Air*, P. 2. 137. 164, 165. a.

Another Magnet *to attract the Aſtral, and vivifying Rays of the Sun, and to render them corporeal, palpable, and conſtant in the Fire*, P. 1. 390.

Magnet *attracting Water, its manifold uſes*, P. 2. 64. Magnet *to attract from Gold, its Tincture*, 165.

Malting, *the differences*, P. 1. 57. Malt, *its Fermentation, in order to diſtill from it a burning Spirit*, 58.

Mars *or Iron to purifie by* Saturn *and Salts*, 133. a. Mars *and* Venus *to conjoyn inſeparably, and their Tinging blood to prepare*, P. 3. 31. b.

A Medicine *to remove all Obſtructions of the Bowels and Veſſels, and ſtrengthen the Stomach, to prepare*, P. 2. 152. b. *An Univerſal* Medicine *may be prepared in a few days for Ten ſhillings charge*, P. 3. 58. a.

Megrim, *cured by Spirit of* Sal-Armoniack, P. 1. 50. a.

Medicines *Univerſal, their excellency above particular*, P. 2. 180. b.

Menſtruum *to extract the fixt Sulphur or tinging Anima of Metals*, 21. Menſtruum *diſſolving Copper mixt with Gold, and precipitating the Gold*, 43.

Mercurius Vitæ, *to prepare*, P. 1. 8.

Mercury *not cold, as the vulgar think, but hot and fiery*, 137. b. 142.

Mercury *precipitate red, to prepare,* P. 1. 28. a. *Yellow precipitate of* Mercury, *kills Lice,* 29. a. Mercury *abused in Physick,* 28. b. Mercury *to Coagulate into a hard body,* 142. a. Mercury *to fix with the moist fires of Salts, so as constantly to abide the fire,* P. 2. 26, 27. *To prepare into a Red Powder strongly purging,* 28. Mercury *Coagulated into a fixt white Body,* 161. a. *To purifie by a Fulmen, so as after it may be easily fixt,* P. 3. 71. *Common* Mercury *purified and fixt into a Red Powder in two or three days,* 192. a. *It enters Gold and augments it,* 196. a. *Common* Mercury *hath in it self no Tincture,* P. 3. 16. *How it may acquire Tincture, and by preparation become the Mercury of Philosophers,* ibid. *How to fix it by Animal superfluities,* P. 3. 89. b.

Mercury *of Antimony to prepare, either Purgative or phoretick, with its excellent use in Physick,* P. 2. 161, 183.

Mercury *of* Saturn, *and of* Lune, *to prepare,* 127. a. P. 3. 15. *They fix Common Mercury,* ibid. Mercury *of* Saturn *may be distilled into a sweet Milk, and then coagulated into a Stone, which Coagulates* Argent-vive, P. 2. 116. Mercury *of* Saturn *fixed into Gold,* 137.

The Mercury *of Metals is the* Mercury of Philosophers, P. 3. 12. a. 69. b. *Divers ways of extracting it,* 12, 13. P. 2. 67. per se 158. *Advise to seek* Mercury *in* Saturn, *and* Sulphur *in* Mars, *rather than in Gold and Silver,* P. 3. 12. a. *A Tinging* Mercury *to prepare out of Antimony,* 14. *Antimony yields more* Mercury *than Vitriol,* ibid. *A Tinging* Mercury *to prepare out of* Mars *and* Venus, ibid. P. 3. 72. a. *Out of* Jupiter, 15. Mercury *to prepare out of Metals and Minerals, by the help of Tartar onely,* 14, 15. *The* Mercury *of Metals to prepare by the Salt of the World,* P. 3. 73. a.

The Mercury of Philosophers *to prepare by the help of Secret* Sal-Armoniack, P. 2. 182. *The Mercuries of* Jupiter *and* Mars, *being conjoyned, are together instantly converted into fixed Gold,* ibid. *A Philosophick* Mercury *to prepare in great quantity, without charge,* P. 3. 16. *The* Mercury of Philosophers *being set at liberty, carries with it self its own Tinging Sulphur,* 12. b. *How to prove whether the Mercury of Metals be well prepared or not to give a Tincture,* 13. *The conjunction and fixation of the* Philosophick Mercury *with Gold,* ibid.

Of the Mercury *of Wine,* P. 3. 55. a. *Its Preparation,* P. 2. 67. *Its admirable Vertues,* 189. P. 3. 68. b. *Experiment of turning it into a red Stone, which tinged Silver into Gold,* 75. b.

Metals, *how generated,* P. 1. 115. b. Metallick Mines *discovered by various accidents,* 120. *How to find them by Art,* ibid. *The Hazle rod fallacious,* ibid. *Metals and Minerals have their birth from one Common Seed,* 121. a. Metalline Seed *as capable of Multiplication, as the Vegetable and Animal,* 363. a.

Metals, *how to separate,* P. 1. 70. *From each other by precipitation,* 325. b. N. B. 334. a. *To separate the courser* Metals *from each other,* 72. Metalline Oars, *how to prove what Metal they hold,* 172. Metals *may be purified in two or three hours time,* 357. a. Metals *to amend, and concentrate by Nitre,* 201.

Metals *imperfect, changed into more perfect, by the help of Salts,* P. 1. 177, 178. P. 2. 11. *How to be slain by their Enemies, and transmuted into better,* ibid. Metals *fugacious and of no worth, to ripen by Common Salt and Fire, so as to yield Gold and Silver with profit,* 35.

Metals, *how purified,* P. 2. 117. a. *Their Reduction into Calxes, as* Crocus Martis, Minium, *Red Precipitate,* &c. *no true purification,* ibid. *How to make* Metals *grow up like Vegetables, before the Eye, to the length of a finger or more in the space of two or three hours,* P. 1. 178. P. 2. 59. a. *Metallick Tree, with its parts,* P. 2. 105. b. Magnesia *grows up into a blood-red Tree,* P. 3. 59. a.

Metals *not to be spiritualized with Corrosive Waters, by distillation,* 132. a. Metals, *notwithstanding, may be depurated, and made volatile by distillation,* P. 2. 127. b. Metalline *Spirits coagulate and fix Mercury,* 153. b. Metals *are so destroyed by the Fulmen of* Jove, *that they cannot be again reduced into Metallick Bodies by melting, but pass into Glass of divers Colours, which Glass being again reduced by Art, yields much better Metals than before,* P. 1. 201. b. Metals *not to be amended but by Sulphur,* P. 1. 375. a. Metals *to distinguish, by the colour of their Fumes, and figure of their Motion, in the fire,* P. 1. 272. b. 273. a. *The* Metals *have divers names imposed upon them by the Poets,* 401. a.

Metallick Tincture *to prepare,* P. 1. 204. a.

A Metallick *Medicament to prepare, profitable in all distempers of the Brain,* P. 2. 116. *What is to be held concerning the perfection of* Metals, P. 1. 72.

Minerals, *of their kinds and difference,* P. 1. 318. *How to be tried,* P. 1. 69. 322. P. 2. 22. a. *Whether they may be transmuted into Metals, and into what,* P. 1. 77. Minerals *poysonous, how to be corrected by the moist fire of Salt, and to be converted into good Medicine,* P. 2. 26. Minerals *after they have been extracted with* Aqua Regia *will still afford Salt-peter with profit,* P. 2. 12.

Mines *and Stones, that are poor in Silver and Copper to extract by a moist way,* P. 2. 14, 15. *Minerals stubborn and glassy, are subdued in the fire with fixed Salts,* P. 1. 332. b.

Mice *delight in Salt,* P. 1. 169. a.

Money, *how to improve it without putting it to Usury by a Metallick work,* 194. *Gold more profitable to be used in this work than Silver,* 197. b.

Mountains *burning, not Hell, as some think,* P. 1. 118, 119.

Rapes, Radishes, *and other things to make grow far larger and fairer than usual by planting their Seeds in their Roots*, P. 3. 35. b.
Ripley's *Toad, mentioned in his Dream, what*, P. 2. 217. a.
Rivers *afford Stones rich in Gold and Silver*, 81. a.

S

THE Salt *of the* Ocean *(as a Universal Agent) gives nourishment to all things which grow on the Earth*, P. 1. 248, 249, 255, 256. P. 3. 33.
The Sea-water *abates of its saltness the nearer it is to the North*, ibid. *Of the Precipitation of the* Salt *from Sea-water, and rendring it drinkable*, 284. b. 285. a. *Common* Salt *containeth spiritual Gold, which may be rendred visible by Art*, 283. a. *It preserveth both the living and the dead from Corruption*, ibid. *It conduceth much to the fatning of Hogs, and other Beasts*, ibid. *Common* Salt *kills Vegetables, as it is, but turn'd into a Lixivial Salt, promotes Vegetation*, P. 1. 89.
Common Salt, *when throughly purified, always hath the shape of a Cube or Square*, P. 1. 274. a. *How it is to be so purified*, ibid. b. Salt *advanceth and conducteth the Vertues or Vices of what it is conjoyned with, whether good or evil*, 262. b. *Examples proving the same in Mercury and Orpiment*, ibid. Salt *feigned to declare its own Vertues*, 254. a. 274. a.
Common Salt *may be transmuted into a burning Spirit, into true Salt-peter*, P. 1. 193. b. 405. a. *It may in a few hours obtain the Nature of* Pot-Ashes, *and serve for all uses to which they are put, as for* Soap-boylers, Glass-makers, *&c.* 406. *a.* Salt *is able to draw out the* Anima *of Gold, and leave its Body of the colour of Lead, and brittle and fugacious like Antimony*, 258. a. Salt *is the Symbol of Eternity*, 254. b. *It corroborateth the Heart more than Wine*, 256. b.
The fruitfull nature of Salt *appears from the Multiplication of Fishes, beyond Birds and Animals*, P. 1. 257. b. Salt *and Fire transmute the vile Metals, into more Noble. An evident demonstration*, 434. *The* Salt *of the Microcosmick Sea, far more potent in the ripening of Metals, than the Salt of the* Ocean, 396. a. *The* Spirit *and* Salt *of the World being added to any dissolved Metal, and distilled, carries over the Tinging* Anima *of the Metal*, P. 3. 18. b. Salts *simple and compound, their excellency in Alchymy*, 434. b. N. B.
Secret Sal-Armoniack, *its description, preparation, and use*, P. 2. 178. *Its use in the amending of Metals*, 198. *It performs more than* Helmont *hath attributed to his* Alcahest, 186. a. *Divers Medicines for the Stone to prepare with it*, ibid. *Volatile Salt of Wine or Tartar, to prepare*, P. 3. 69. a.
Secret Sal-Armoniack, *of various preparations*, P. 2. 209. a.
A wonderfull Sal-Armoniack *to be prepared from the fæces of Tin*, 202. b. *It inseparably conjoyneth Gold and Silver*, 203. a. N. B. *It is a Magnet to draw Tinctures*, 204. b. *Being dissolved in Spirit of Salt, it attracts Gold or Tinctures from Metallick Solutions, and precipitates them in form of a purple or blood-red Powder*, 205. a. *It extracts and exalts the Colours of Vegetables and Animals*, ibid. *He that hath it, and knows its use, needs no Books*, ibid.
A Spiritual Sal-Armoniack *or* Alcahest *described, which can extract the Tinctures of all red Bodies, and again introduce them into white Bodies, without altering the figure of either*, 209, 210. a. *It maketh Gold as volatile as Spirit of Wine, in three hours space*, 210. b. *And again changeth it into a transparent, fixt, tinging* Carbuncle, 212.
Sal-Mirabilis, *its Original*, P. 1. 223. *Of its Name and Vertues*, 224. *Its Preparation*, 225, 261. *Of its outward Figure and Taste*, 261. *Enigmatical description of its Use*, 254. *Its use in Physick, Alchymy, and Mechanick Arts*, 226, 227, 228, 262. *Of its wonderfull power in the kingdom of Vegetables*, 224. *How it is to be prepared for that use*, P. 2. 47. *It restores Trees and Insects, half dead, to life*, P. 1. 410. b P. 2. 47. *The use of* Sal-Mirabilis *in dissolving of Metals, and preparing of Medicines*, P. 1. 264. P. 2. 48. *Its Universal use in the emendation of Metals*, P. 2. 50. *How by it the imperfect Metals may be made perfect*, ibid. *The Author by its help hath often tinged one end of an Iron Wyer, into Copper, and the other into Gold*, P. 1. 229. b.
Sal-Mirabilis *to strengthen by its own Spirit*, P. 1. 411. a. *A graduating Spirit of* Sal-Mirabilis, P. 2. 68. b. *How to know if the* Sal-Mirabilis *be well prepared*, 53. *How by it any Grain or Seed may be encreased a Thousand fold*, 54. *How it is profitable for* Vineyards, 54, 55. *Divers profitable uses of it about* Wines *and* Brandy, 55, 56.
Sal-Mirabilis *turns Water, Wine, Ale, and other Liquors into hard pieces, like Ice, in a few hours space*, P. 2. 44. *It Coagulates all acid corrosive Spirits in like manner*, ibid. *It stops the head of a Fountain*, ibid. *Separates the phlegm from subtile Spirits*, ibid. *Congealeth the breath of Men into Ice, with other Operations*, ibid. *It betters all Wines as it were in a moment*, 45. *How it may benefit those who travel in Winter, or sail on the Seas*, P. 2. 46. *How it mends Brandy made of Corn, so as to become equal to that made of the Lees of Wine*, ibid. *The same by Vinegar*, ibid. *It amends Oyls*, 47. *It takes away Must or Stink from all Vessels*, ibid. *It preserves all kind of* Fruits, Eggs, Onions, *&c. a long time from corrupting*, ibid. *It turneth Wood into a Stone*, ibid. *How it dissolveth all hard Subjects*, ibid.
Sal-mirabilis *reduceth a Charcoal into its* first matter *in the space of half an hour*, 48. *How it renders the Vegetable Sulphur visible*, ibid. *yields a Medicine but little inferiour to* Aurum Potabile, ibid.
Salt of humane Dung *among all Salts, onely generates putrefaction*, P. 2. 159. b.
Salt-peter, *see Niter.*
Salt *graduating Silver, to prepare*, P. 1. 34. a.
Salt of Tartar *to purifie by Flints*, 153. b.
Salt-water *takes the Salt out of saltish Flesh, or Fish*, 37. b.
Of the Salt of Philosophers, *its preparation, use, and efficacy in Physick and Chymistry*, P. 3. 17. *It transmutes all imperfect Metals into Gold, and common*

Stones

Stones into precious ones; but hath no ingreſs into common Mercury, 18. a. *It draws the Tinctures from red Subjects, and leaves the body white*, 19. a. *Experiment of the red* Salt *or Stone of* Philoſophers *drawing the Tincture from Gold*, P. 3. 20. *It gave to Glaſs ſuch a toughneſs, as it might be bowed like Steel-wyer, without breaking*, Ibid. *The Author reſtored by it from two years continual Sickneſs, to Health*, ibid.

The Secret Salt of Philoſophers, *(or their* white Eagle) *being diſſolved in Common Water, renders the ſame able to glew Paper together, and makes inſeparable Conjunctions*, 31. b. 52.

The Salt of Art *exalts both* Sol *and* Lune *into Tinctures*, P. 3. 53. a. *It both maketh fixt and volatile*, ibid.

Sanguis Draconis *and* Salamander *of the Philoſophers, how produced*, 28, 29. *Its Inceration and Multiplication*, 29. b. Sanguis Draconis *to unite and fix, with* Lac Virginis, P. 3. 31. a.

Satur *waſhed to the higheſt Whiteneſs, with Common Salt, is then a Bath for Metals*, P. 1. 402. a. *The manner of preparing and uſing that Bath*, 403, 404.

Seeds *of Vegetables conſiſt in a Lixivial Salt and Sulphur*, P. 1. 89. b.

Silver *to extract from poor Oars, by the moiſt way*, P. 1. 425. Silver *Calxes to reduce into a body without loſs*, ibid. P. 2. 14, 42. Silver *to ſeparate from Biſmuth, and the Biſmuth preſerved*, P. 1. 176. *From old Copper, and the Copper preſerved*, ibid. Silver *to exalt into Gold, in a few hours*, 177. P. 2. 49. Silver *to Tranſmute into Gold*, P. 3. 44. b.

Silver *is inwardly full of Tincture*, P. 2. 144. a.

Silver, *its Cryſtals to prepare, with their uſe*, P. 1. 26. *Its Tincture*, ibid. *Its green Oyl, with its uſe in Phyſick, Alchymy, and Mechanicks*, 27, 391. b. *The Silver Tree*, 334. b.

Smiths Files, *and other Tools, to make as hard as the beſt Steel*, P. 1. 180.

Spots *or* Stains *to take out of Cloaths*, ibid.

Spiders *under a year old, not poyſonous*, P. 2. 96. b. *They will live three months without ſuſtenance*, ibid.

Spirits *Terreſtrial and Elementary, their great Power*, P. 2. 171.

Spirits, *what they are, and by what means they operate good or evil*, P. 2. 23.

Spirit of Salt *to diſtill without Retorts, with its uſe*, P. 1. 3. 418. 283. b. Spirit of Salt, Salt-peter, *or* Aqua Regia *to acquire eaſily, ſo that one pound of it may be made with two or three pound of Coals, and needs no rectification*, 225, 374. a. Spirit of Salt *ſerves for Kitchen uſes better than Vinegar*, 5, 10, 378, 379. *Its great Vertues in Phyſick*, 287. Spirit of Salt Tartarized, *to prepare*, 392. a. *It allays Thirſt beyond all other remedies, and is of many good uſes in Phyſick*, ibid. Spirit of Salt, *and Allom, volatile to prepare*, P. 1. 22. *The uſe of* Spirit of Salt *in Ships againſt* Thirſt, *and the* Scurvy, 284. *The* Spirit of Salt *in Apothecaries Shops, of little worth*, 283. a.

Spirit of Antimony, Tartarized, P. 1. 30. a. 41. Spirit of Corals *and* Sugar, *red, to prepare*, 53. Spirit of Salt of Tartar, *and other fixed Salts*, 11. Spirit of Salt of Tartar, *with crude Tartar to diſtill*, 44.

Spirit of Salt-peter, *white and acid, and red and volatile, to prepare, with their uſe*, P. 1. 23. Spirit of Niter *Sulphurated*, 29. a. *Tartarized*, 30. a.

Acid Spirit, *or Vinegar to diſtill from all Vegetables*, P. 1. 10. b. *From Wood, in great quantity*, 188, 189.

Spirit of Stone-Coals, P. 1. 30. b. *It cures* Scald Heads *and all running* Ulcers, ibid.

Spirit of Grape-ſtones, *a Specifick for the* Stone *and* Gout, 54. a. Spirit of Gun-powder, 32. Spirit of Hair, *and* Horns, 11. *Of* Man's Hair, 52. *It diſſolveth Sulphur into a Milk, and may be fixt into a Ruby*, ibid. *Of* Harts-horn, *with its Vertues*, 51, 52. Spirit of Honey, *to prepare*, 11, 52. Spirit of Sal-Armoniack, *or* Urine, *to prepape*, P. 1. 49. *Its Vertues and Uſe*, 50.

Spirits *and* Salts *of Minerals*, P. 1. 12.

Spirits *of* Metals *and* Minerals *volatile*, P. 1. 22. P. 2. 71. b. 162, 218. a. Spirit of Zinck, *to prepare*, P. 1. 23. *Of the Droſs of* Regulus Martis, *ibid.* Spirit of Saturn, 36. *It is a meer poyſon, but of great power in Alchymy*, P. 2. 164. a. Spirit of Jupiter, P. 1. 33. Spirit of Mars, *with its Vertues*, P. 3. 46. b. Spirit of Gold, *and* Silver, *Tartarized*, P. 1. 41. Spirit of Mercury *Tartarized*, ibid.

Spirit of Muſt, *or new Wine, to prepare*, P. 1. 53. Spirit of Paper, *and Linnen Cloth*, 11. Spirit of Silk, *ibid.* Spirit of Sugar, *with its Oyl*, 53. Spirit of Tartar, 36. *Its Uſe*, 37. Spirit *and Oyl of* Tartar *joyned with Metals and Minerals*, 38. Spirit of Vinegar, Honey, *and* Sugar, 11. Spirit of Sulphur, 54. Spirit of Vitriol *volatile, with its vertues and uſe*, P. 1. 17. P. 2. 237, 238. a. Sulphur of Vitriol *Narcotick, uſe and doſe*, ibid.

A Spirit *to be drawn from* Wine *(by the help of a ſecret Ferment) by which other Wines may be amended*, P. 2. 153. b. *From* Tartar, *by the ſame Ferment*, 218. b. Spirit of Wine, *to prepare, that will draw out the Tincture of Gold*, 139. Spirit of Wine, *by its flame, dulcifies all ſowr and bitter things*, 190. b. Spirit of Wine Alcolizate *extracts the Tinctures of all things, and carries them over the Helm, is of admirable uſe for Phyſicians, and may be acquired as cheap as other good Spirit of Wine*, 186. b. Spirit of Wine Alcolized *with the* Salt of Art, *carries over the Helm the Eſſences of Vegetables, Animals, and Minerals*, P. 3. 54, 56. a.

Springs, *whether ſalt or ſweet, their Original*, P. 1. 248. b. 249. *The reaſon why ſome* Springs *are freſh and others ſalt, and why ſome are more ſalt than others*, P. 1. 256.

Steel *or Iron to Solder without Fire or Braſs, onely by a Liquor*, P. 1. 180. Stone *of the Reins and Bladder, the cure*, P. 2. 24. b. 58, 88. b. 95. a. 102. b. 122. b. P. 3. 55.

Stone of Fire *of Baſil Valentine*, P. 3. 65. *Its great power and vertues*, ibid. Stones *prepared by the Author, Tinging Metals*, P. 3. 37.

Sulphur, *burning, is the ſymbol of Death*, P. 1. 254. b. Sulphurs *kill all Corroſives, and reduce them to a ſweetneſs*, 386. b. *Vegetable* Sulphurs *perform it in one hours ſpace, either in the dry or moiſt way*, ibid.
